Despite the low fraction of the atmosphere occupied by clouds and the low fractional volume of clouds occupied by liquid water, reactions in cloudwater can be important pathways for chemical transformation of atmospheric trace gases. To address the concern with specific reference to H_2O_2 production by free radical reactions, we have undertaken a study in which the rate of change in H_2O_2 concentration is monitored in synthetic and authentic cloudwater in which $O_2(-I)$ radicals are produced at rates comparable to those expected upon transfer of HO_2 from interstitial cloud air to cloudwater.

51691 Model test of CCN-cloud albedo climate forcing. Ghan, S.J. (Lawrence Livermore National Lab., CA (USA)); Taylor, K.E.; Penner, J.E.; Erickson, D.J. III. *Geophysical Research Letters (American Geophysical Union) (USA),* 17(5): 607-610 (Apr 1990).

Cloud condensation nuclei (CCN) influence cloud albedo through their effect on the cloud droplet size distribution. A number of studies have evaluated the climatic impact of the CCN-cloud albedo feedback, but all have assumed that cloud distributions, cloud thicknesses, and cloud liquid water contents would remain constant as the climate adjusted. The authors have tested this assumption using the Livermore version of the National Center for Atmospheric Research (NCAR) Community Climate Model (CCM1). The results indicate that there are no significant compensating changes in cloud properties that would counteract the 1.7% global albedo increase resulting from a fourfold increase in marine CCN concentration. Furthermore, when ocean surface temperatures are decreased 4°C in a manner broadly consistent with the enhanced cloud albedos, they predict an increase in cloud fraction of 3.5% and a reduction in cloud altitude, leading to a positive feedback from clouds that would imply a climate impact roughly double that calculated from cloud droplet size distribution change alone.

51692 An intercomparison of measurements of aerosol elemental carbon during the 1986 carbonaceous species method comparison study. Hansen, A.D.A. (Univ. of California, Berkeley (USA)); McMurry, P.H. *Journal of the Air and Waste Management Association (USA),* 40(6): 894-895 (Jun 1990). DOE Contract AC03-76SF00098.

For 10 days in August, 1986, equipment from many different organizations was set up at a location in the suburban Los Angeles area for sampling carbonaceous pollutant species in all forms. The authors report here on the intercomparison of two quite dissimilar sampling and analysis methods for aerosol elemental carbon. The two methods being compared are: University of Minnesota - impactor samplers with one or more stages, backed up by a quartz fiber afterfilter; elemental carbon (EC) analysis by oxidation in helium over an MnO_2 catalyst; Lawrence Berkeley Laboratory - real-time measurements with aethalometer, an optical absorption technique on a continuously collecting quartz fiber filter. The good agreement between the results suggest that there may be an approach towards an acceptable measurement standard for this important atmospheric pollutant species.

51693 (CHOA–89304ACC0387, pp. 1-14) **Clean-up of oil waste material contaminated soil.** Ignasiak, T. (Alberta Research Council, Devon, AB (Canada)); Carson, D.; Szymocha, K.; Pawlak, W.; Ignasiak, B. Canadian Heavy Oil Association (Canada). [1989]. (CONF-8911238–: Heavy oil production and the environment. Quarterly meeting [of the] Canadian Heavy Oil Association, Calgary (Canada), 14 Nov 1989; CE–03151). In *Heavy oil production and the environment.* vp. Source: Canadian Heavy Oil Association, 425, 808-4 Avenue S.W., Calgary, AB, CAN T2P 3E8. Prices: $35.00 CAN.

A process has been developed for clean-up of soil contaminated with various oily waste materials. The process utilizes coal as a cleaning agent, and is based on the principles of oil agglomeration with contaminants acting as the bridging liquids. In the procedure known as AGLOFLOAT, the contaminated soil is mixed with a coal-water slurry. The products, in form of the contaminant wetted coal microagglomerates, are separated by flotation from the clean soil. Attrition taking place in the tumbler, and the sorption capacity of the coal have a major effect on process performance. Bench-scale experiments have been conducted with samples contaminated with coal derived tar, heavy oil as well as oil spills. The contaminant concentration in the samples ranged from less than 1% to over 40%. The parameters investigated were temperature, contaminant/coal ratio, solids concentration, agitation and residence time. As a result of parametric studies a set of general process conditions was established. The AGLOFLOAT process appeared to be very effective in clean-up of contaminated samples. The residual tar remaining in the processed soil ranged from 0 to a few tenths of a percent. The effectiveness of the cleaning procedure appeared to be dependent on the composition of the contaminated samples and also on the particle size distribution of solids. The process is now being tested in a 6 tonne/day continuous facility. Economic analysis of this clean-up technology indicates that, subject to availability of coal on the clean-up site and utilization of the generate agglomerates, the process cost will vary from $13-49 per tonne of contaminated soil. 11 figs., 3 tabs.

51694 (CP/PQ–50) **The effects of acid precipitations on wetlands.** Anderson, J.M. Environment Canada, PQ (Canada). Conservation and Protection. Dec 1986. 49p. (MICROLOG–90-03122). Source: PC Environment Canada, Departmental Library, Ottawa, ON, CAN K1A 0H3; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

The effects of acid precipitation on wetlands have only recently become the focus of extensive research. This report summarizes the existing information on the sensitivity of wetlands to acid precipitation and provides recommendations for future research. The report consists of five major sections, starting with a review of the literature on the effects of acid precipitation on wetland hydrology, hydrochemistry, vegetation and wildlife. Current data is sparse, so it is only possible to approximate wetland sensitivity to acid precipitation. Preliminary criteria with which to rate wetland sensitivity to acid precipitation are presented. These criteria are developed and used to rank the major wetland classes in Canada. It has been determined that poor fens and poor swamps are the most sensitive to acidification. A summary of current research in eastern North America addresses the effects of acid deposition on wetlands. A peatland survey in Ontario is used as an example for a proposed regional evaluation of wetland acidification impacts. A summary and list of recommendations for further research are also included. In conclusion, literature shows that nutrient-poor wetlands are important captors of sulphate, nitrate and ammonia ions contained in acid rain; the amount of the acid deposits that can be assimilated without modifying the hydro-chemical requirements of these vulnerable wetlands would be limited. A list of definitions of the classes of wetlands existing in Canada is provided. 75 refs., 1 fig., 3 tabs.

51695 (DOE/BP/18966–3) **Ural-tweed bighorn sheep wildlife mitigation project: Final completion report.** Young, L. (Forest Service, Libby, MT (USA). Kootenai National Forest); Yde, C. Forest Service, Libby, MT (USA). Kootenai National Forest; Montana Dept. of Fish, Wildlife and Parks, Missoula, MT (USA). Jun 1990. 38p. Sponsored by U.S. DOE Office of Administration and Human Resource Management; U.S. DOE Bonneville Power Administration. DOE Contract AI79-84BP18966. Order Number DE91000191. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The results of habitat improvement project activities accomplished under contract #84–38 for bighorn sheep mitigation along Koocanusa Reservoir from September 1, 1984, through June 30,

1990, are reported here. Habitat treatments were applied to ten areas and covered 1100 acres. Treatments used were prescribed fire, slashing combined with prescribed fire, and fertilization. Several variations in season or intensity were used within the slashing and prescribed fire treatments. This project was coordinated with and complemented concurrent Kootenai National Forest habitat improvement activities. 15 refs., 2 figs., 3 tabs.

51696 (DOE/ER/60241–1) **Leaf exsertion, leaf elongation, and leaf senescence in Eriophorum vaginatum and Carex Bigelowii: Final report.** Shaver, G.R.; Yandow, T.; Laundre, J. Marine Biological Lab., Woods Hole, MA (USA). Ecosystems Center. [1990]. 59p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER60241. Order Number DE90014740. Source: NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Most of the common sedges of arctic vegetation show a pattern of leaf production in which the exsertion and elongation of new leaves is more or less simultaneous with the senescence of old leaves. The present study was designed to increase our understanding of the variability sequential leaf production by arctic sedges, and to determine some of the controls on that variability. We did this in two ways: first, we compared the sequential patterns of leaf growth and senescence in E. vaginatum with those of Carex Bigelowii Torr. at two tussock tundra sites near Toolik Lake on the North Slope of Alaska. Second, we compared the responses of leaf growth in these species in control and fertilized plots and in two microenvironments thought to differ sharply in nutrient availability and total productivity. 29 refs., 28 figs., 2 tabs.

51697 (DOE/ER/60547–1) **Measurement and apportionment of radon source terms for modeling indoor environments.** Harley, N.H. New York Univ., NY (USA). Dept. of Environmental Medicine. [1990]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER60547. Order Number DE91000823. Source: NTIS, PC A01/MF A01; OSTI; INIS; GPO Dep.

This research has two main goals; (1) to quantify mechanisms for radon entry into homes of different types and to determine the fraction of indoor radon attributable to each source and (2) to model and calculate the dose (and therefore alpha particle fluence) to cells in the human and animal tracheobronchial tree that is pertinent to induction of bronchogenic carcinoma from inhaled radon daughters.

51698 (ESP–90-04736) **Changes in the decline status of hardwood forests in Ontario, 1986 to 1987.** Ecological Services for Planning Ltd., Guelph, ON (Canada). Dec 1989. 229p. (MICROLOG–90-04736). Source: PC Ontario Ministry of the Environment, Public Information Centre, 135 St. Clair Ave. West, Toronto, ON, CAN M4V 1P5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC N/C; MF $10 CAN.

The Hardwood Decline Survey (HDS) was intended to assess the degree and extent of existing damage to selected hardwood forest sites in the Great Lakes-St. Lawrence and Deciduous Forest Regions of Ontario. The objective of the 1987 survey was to provide both a temporal and a spacial perspective on the changes in the condition of the hardwood resource in Ontario. This report documents the results of the reassessment of the province-wide HDS plots conducted in 1987. Other than the plots corresponding to areas of severe defoliation, average decline indices for 1987 were very similar to the results from the 1986 survey. For the majority (67%) of the non-defoliated plots, the decline indices changed less than one standard deviation. This suggests that decline index mapping is repeatable from year to year, and supports the validity of the assessment procedures used. Currently, 3.4% of the trees in the HDS plots are dead. Approximately 1.3% mortality has occurred since the 1986 survey. The strongest correlations of the mean decline indices for 1987 are with insect defoliation levels within the plots. There are no consistent patterns that are discernible with respect to wet sulphate deposition within the study area. There is a general trend for the northern Ontario plots to have a higher decline index than the plots located in southern Ontario. This is probably related to macroclimatic and soil differences. Within southern Ontario, the plots located in the highest pollution loading area (especially the Aylmer, Cambridge, and Niagara Districts) have higher decline indices than plots located in the central and eastern portions of southern Ontario, where climate and soil conditions are similar. 18 refs., 125 figs., 16 tabs.

51699 (IC–90/113) **Three frequency model for the retrieval of vertical profile of soil moisture through passive microwave remote sensing techniques.** Rao, K.S. (International Centre for Theoretical Physics, Trieste (Italy)); Rao, Y.S. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 16p. Order Number DE91604139. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Three frequency model is developed for the retrieval of soil moisture vertical profile up to a depth of root zone based on statistical inversion technique coupled with apriori information on the general trend of soil moisture variations. The model has been tested with simulated data and experimental data. The model has the flexibility for operational implementation and online processing. (author). 14 refs, 6 figs.

51700 (INP–1388/AP) **NEWCROSS.BAS program 26 neutron group cross section library for geophysical applications.** Czubek, J.A. Institute of Nuclear Physics, Cracow (Poland). 1988. 36p. Order Number DE91604877. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

BASIC/IBM PC.

For the elements: H, B, C, N, O, F, Na, Mg, Al, Si, Cl, K, Ca, Ti, Cr, Mn, Fe, Ni and Pb a 26 neutron group library of cross sections has been calculated for energies ranging from 14 MeV down to 0.215 eV. The following cross sections have been calculated: SR(J) - removal, STR(J) -transport and SL(J,L) - slowing down from the energy group J down to the group J+L. These group cross sections have been calculated using the algorithms proposed by Kreft starting from the microscopic cross section library of Abagyan et al. The library is in the form of the program NEWCROSS.BAS written in BASIC for IBM PC microcomputers. This library is used to calculate the slowing down parameters of rocks using the programs SLOWDOWN.BAS, SLOWN1.BAS or SLOWN2.BAS. (author).

51701 (INP–1403/AP) **NEROTH.BAS program for rock thermal neutron parameter calculations.** Czubek, J.A. Institute of Nuclear Physics, Cracow (Poland). 1988. 51p. Order Number DE91604879. Source: NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

BASIC/IBM PC.

The paper describes the NEROTH.BAS program calculating the thermal neutron diffusion rock parameters averaged over the neutron spectrum: absorption cross section, diffusion coefficient and diffusion length. Besides the listing of the NEROTH.BAS program all formulae used to calculate these parameters are reported. The calculation is based on the microscopic neutron cross section data files created by another program THERCROS.BAS, which is also included in this report. The resulting output data can be stored on a disk and then retrieved by using the program REPROTH.BAS. The following input data are needed for the calculation: the elemental composition of the rock matrix, its mineralogical density, porosity, water saturation, brine salinity and the density of hydrocarbons. The calculation can be carried out with varying porosity, or water saturation index or brine salinity. The matrix elemental composition can be introduced into the calculation either in oxide form or as the content of particular elements. There are no technical limitations as concerns the elemental composition of the rock matrix. The results are also given for neutrons of velocity of 2200 m/s. (author).

51702 (INP–1412/AP) **Report to the International Atomic Energy Agency: Agency Research Contract No 4121/R2/RB.** Woznicka, U. (ed.). Institute of Nuclear Physics, Cracow (Poland). 1988. 32p. Contract 4121/R2/RB. Order Number DE91604140. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The results of search done under the International Atomic Energy Agency Contract no 4121/R2/RB: "Measurement of the thermal neutron macroscopic absorption cross-section on small rock samples" at the Institute of Nuclear Physics during the period from July 1, 1987 to June 30, 1988 are presented. The report contains the determination of the correction curve based on the measurement of the solutions of H_3BO_3 (IRM) including the definite neutron parameter for plexiglass moderator; the theoretical approach to the application (as the external moderator) of teflon -

the material having lower thermal neutron absorption cross section than the typical rock material. (author).

51703 (LA–11941-MS) **Sigma Mesa: Background elemental concentrations in soil and vegetation, 1979.** Ferenbaugh, R.W.; Gladney, E.S.; Brooks, G.H. Jr. Los Alamos National Lab., NM (USA). Oct 1990. 22p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract W-7405-ENG-36. Order Number DE91000018. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In 1979, soil and vegetation samples were collected on Sigma Mesa to provide background data before construction on the mesa. Elemental data are presented for soil, grass, juniper, pinon pine, and oak. None of the data looks out of the ordinary. The purpose of the sampling program was to acquire, before any disturbance, a set of data to be used as background for future impact analysis. 6 refs., 2 figs., 7 tabs.

51704 (LBL–29128) **First-order kinetics-controlled multiple species reactive transport of dissolved organic compounds in groundwater: Development and application of a numerical model.** McNab, W.W. Jr. Lawrence Berkeley Lab., CA (USA). May 1990. 154p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE91000188. Source: NTIS, PC A08/MF A01 - OSTI; GPO Dep.

Reactive chemical transport models developed over the past decade have generally relied on the assumption that local thermodynamic equilibrium is achieved at all times between aqueous species in a given system. Consequently, homogeneous aqueous systems characterized by a number of kinetically slow reactions, particularly problems involving organic species, cannot be satisfactorily modeled. In this study, we present a prototype computer model, KINETRAN, which is designed to handle kinetically-controlled homogeneous reactions in the aqueous phase, along with the transport of the various species involved, through geologic media. 31 refs., 53 figs., 10 tabs.

51705 (NAGRA-NTB–90-13) **Radionuclide chain transport with matrix diffusion and non-linear sorption.** Jakob, A. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Hadermann, J.; Roesel, F. Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland). Feb 1990. 64p. Source: Available from Nagra, CH-5401 Baden, Switzerland.

The present paper describes a two-dimensional model for radionuclide transport in inhomogeneous rock. Advective and dispersive flux takes place in water conducting zones which may consist of a network either of tubelike veins or planar fractures. Out of these flowpaths nuclides diffuse into stagnant pore water of a spatially limited, adjacent zone (matrix diffusion). Sorption on rock surfaces is described by a non-linear isotherm. Under specific conditions matrix can be represented by an effective (non-linear) surface sorption. Radioactive decay and, in the case of a nuclide chain, ingrowth is also included in the model . The numerical solutions of transport equations based on the method of lines are developed in detail. The advantages of this approach are the efficiency, the reliability and the general flexibility especially to include arbritary boundary and initial conditions and arbitrary solute/rock interactions. For Cs-135 we present in a comprehensive sensitivity analysis the impact of non-linear (Freundlich) sorption isotherm on break-through curves. It is shown that, provided transport times are comparable or larger than nuclide half-life, non-linear sorption may reduce concentrations at the geosphere outlet by orders of magnitude. Some results are also given for the transport. (author) 25 figs., 27 refs.

51706 (NUREG–0837-Vol.10-No.2) **NRC TLD [thermoluminescent dosimeter] Direct Radiation Monitoring Network: Progress report, April–June 1990: Volume 10, No. 2.** Struckmeyer, R.; McNamara, N. Nuclear Regulatory Commission, King of Prussia, PA (USA). Region I. Sep 1990. 222p. Sponsored by Nuclear Regulatory Commission. Source: NTIS, PC A10/MF A01 - GPO; OSTI; INIS.

This report provides the status and results of the NRC Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network. It presents the radiation levels measured in the vicinity of NRC licensed facilities throughout the country for the second quarter of 1990.

51707 (PB–90-234725/XAB) **Response to comments background document for the Third Third land-disposal restrictions proposed rule November 22, 1989, (54 FR 48372).** ICF, Inc., Fairfax, VA (USA). 8 May 1990. 1002p. Source: NTIS, PC EE99/MF E99.

51708 (PB–90-234733/XAB) **Response to comments background document for the Third Third land-disposal restrictions proposed rule November 22, 1989 (54 FR 48372). Volume 2-1. Capacity-related comments.** ICF, Inc., Fairfax, VA (USA). 8 May 1990. 406p. Source: NTIS, PC A18/MF A03.

See also Volume 2-2, PB–90-234741. Portions of this document are not fully legible. Waste.; Also available in set of 3 reports, PC E99/MF E99, PB–90-234725.

On November 22, 1989, the Environmental Protection Agency (EPA, the Agency) proposed a rule to prohibit the land disposal of the final third of the schedule of restricted hazardous wastes, known as the Third Third (see 54 Federal Register 48372). The proposal outlined treatment standards and effective dates of prohibition for these wastes as well as for some First and Second Third soft hammer wastes, characteristic wastes, certain waste groups (e.g., multi-source leachate, radioactive mixed waste), and newly listed wastes. The proposed rule was issued pursuant to the 1984 Hazardous and Solid Waste Amendments (HSWA) to the Resource Conservation and Recovery Act (RCRA). The Agency requested public comment on the proposal. The regulated community, environmental organizations, trade associations, State and Federal agencies, and concerned citizens submitted over 300 written letters on the proposed rule. EPA developed three volumes of a comment response document. This document (Volume 2 of 3) presents a summary of and responses to capacity-related comments received by the EPA docket clerk in response to the proposed rule. The comments have been divided into 17 chapters, each addressing specific comment categories. This volume covers Chapters 1-7. The chapters discuss combustion, ignitable wastes, reactive wastes, arsenic, selenium, and lead wastes.

51709 (PB–90-249640/XAB) **Policy for Superfund compliance with the RCRA land-disposal restrictions. Directive (Final).** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 17 Apr 1989. 12p. (EPA–9347.1-02). Source: NTIS, PC A03/MF A01.

The directive assists the regional removal and remedial staff in making current site decisions about the Land Disposal Restrictions (LDR). The memorandum explains: (1) how to determine when LDRs are applicable to a Superfund removal or remedial action, and (2) the Superfund approach for complying with the LDRs when they are determined to be applicable.

51710 (PB–90-256686/XAB) **Some major factors important in establishing land-use policy for remediated Superfund sites. Technical report.** Crow, S.R.; Cooley, J.L. Georgia Univ., Athens, GA (USA). Dec 1989. 54p. Source: NTIS, PC A04/MF A01.

The report is part of the National Network for Environmental Management Studies under the auspices of the Office of Cooperative Environmental Management of the U.S. Environmental Protection Agency. No explicit federal policy addresses future land use of remediated Superfund sites. The EPA has no official land use policy for these sites and most states have no mechanisms for identifying uncontrolled hazardous waste sites, and no policies or procedures for guiding redevelopment of remediated sites. Historically, land use decisions have been made by local governments. However, local governments are subject to political pressures which impact land use decisions, and may override environmental and health concerns. Thus, federal and state participation is vital in devising land use controls. In the absence of formal policy, a variety of factors impact land use decisions. Four general concerns are scientific uncertainty and technological limitations, cleanup standards and risk assessment, institutional controls, and liability

for remediation costs. The report concludes that the principal goal of land use policy should be to allow the most effective allocation and utilization of available resources to meet the legislative purpose of health and environmental protection. Various possible land use policy objectives are proposed.

51711 (PB–90-259961/XAB) **Biological treatment of soils containing manufactured gas plant residues. Topical report, June 1988-February 1990.** Cushey, M.A.; Morgan, D.J. Remediation Technologies, Inc., Pittsburgh, PA (USA). 11 May 1990. 152p. Contract GRI-5086-254-1334. Source: NTIS, PC A08/MF A01.

The report summarizes the results of an on-going laboratory research program directed by GRI to investigate the feasibility of using biological treatment to remediate soils containing residues from manufactured gas plant (MGP) sites, and to develop and verify a rapid assessment protocol (the GRI Accelerated Treatability Protocol) for determining the potential for biologically treating specific MGP site soils. This protocol, which features soil characterization, desorption testing and slurry reactor testing, is cost competitive with traditional treatability studies and can be completed in approximately half the time. For the first two soils evaluated, total polynuclear aromatic hydrocarbon (PAH) concentrations (a critical class of chemicals at MGP sites) were reduced by 95 and 80 percent to residual plateau concentrations of less than 10 and 5,000 mg/Kg, respectively. It is believed that the magnitude of the plateau concentration is not primarily dictated by the availability of nutrients, oxygen and adequate microbial populations but rather by limitations of mass transfer from the soil-waste matrix to the bulk aqueous phase. Further tests with thirteen other MGP soils are in-progress and the results of these will be reported at a later time.

51712 (PB–90-260118/XAB) **Health assessment for W. R. Grace and Co., Inc./Wayne Interim Storage Site, Wayne, Passaic County, New Jersey, Region 2. CERCLIS No. NJD891837980. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 30 Jul 1990. 17p. Source: NTIS, PC A03/MF A01.

The Wayne Interim Storage Site (WISS) a Superfund site, was formerly owned and operated by the W.R. Grace Company, which used the site for the extraction and concentration of thorium from monazite ore. Off-site contamination occurred via soil transport during storm run-off to drainage areas. The main contaminants at WISS are radionuclides in the thorium-232 and uranium-238 decay series. The site is currently owned by the United States Department of Energy. Large sections of vicinity properties were remediated (excavated) to Department of Energy (DOE) radiological standards from 1985 through 1987. The WISS was prepared to serve as an interim site for the storage of low level radioactive soil. Radioactive materials remain on the WISS and railroad spur area. This site is considered to be of potential public health concern by ATSDR and NJDOH. This site is not presently being considered for follow-up health study or evaluation.

51713 (PB–90-262122/XAB) **Transuranium elements. Volume 2. Technical basis for remedial actions.** Burley, G. Office of Radiation Programs, Washington, DC (USA). Jun 1990. 123p. (EPA–520/1-90/016). Source: NTIS, PC A06/MF A01.

See also Volume 1, PB–90-262114.

The report consists of two volumes and addresses the problem of environmental contamination by plutonium and other transuranium elements. Volume 2 presents the general background relevant to developing criteria for site-specific remedial action options. The information is intended to provide an overall perspective on the considerations necessary for the decision-making process.

51714 (SKB-TR–90-05) **Potential effects of bacteria on radionuclide transport from a Swedish high level nuclear waste repository.** Pedersen, K. (Univ. of Gothenburg, Dept. of General and Marine Microbiology (Sweden)). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1990. 64p. Order Number DE91604134. Source: NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

Microorganisms can influence radionuclide migration if their concentration are high in comparison with other organic particles. Data on the numbers of microorganisms in undisturbed ground-water have been collected. The average number of cells in the samples from 17 levels in 5 boreholes was 3.0×10^5 cells ml^{-1}. A biofilm experiment indicated an active microbial rock surface population. Radiographic uptake experiments suggest inactive bulk water populations. The bulk water microbial cells in deep ground water might then be inactive cells detached from active biofilms. Enrichment cultures for anaerobic bacteria demonstrated the presence of anaerobic bacteria capable of growth on C-1 compounds with hydrogen and carbon dioxide, presumably methanogenic bacteria. Further, growth in enrichment cultures with sulphate as electron-acceptor and lactate as carbon source proved dissimilatory sulphate reducing bacteria to be present. (author).

51715 (SKB-TR–90-06) **Transport of actinides and Tc through a bentonite backfill containing small quantities of iron, copper or minerals in inert atmosphere.** Albinsson, Y. (Chalmers Univ. of Tech., Goeteborg (Sweden). Dept. of Nuclear Chemistry); Saetmark, B.; Engkvist, I. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Apr 1990. 78p. Order Number DE91604135. Source: NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

In the Swedish concept for final disposal of high-level radioactive waste, compacted bentonite has been proposed as a suitable backfill. In order to study the possible effects of different additions to the clay on the transport of REDOX-sensitive nuclides an investigation has been performed where small quantities of iron or copper in different oxidation states or minerals have been added to the clay. The apparent diffusivity (D_a) of the actinides U, Pu, Np and the fission product Tc in compacted bentonite mixed with 1% Fe(0), Fe(II), Cu(0) or Cu(II) and for Np and Tc with 1 or 10% respectively of vivianite ($Fe_3(PO_4)_2$), magnetite or fracture fillings (mainly epidot and chlorite) has been measured in an inert nitrogen atmosphere. The results indicate, especially in the case of Fe(0) or Fe(II), reduction from the higher oxidation states Np(V), U(VI) and Tc(VII) probably to Np(IV), U(IV) and Tc(IV). D_a is reduced by several orders of magnitude, and for Tc with Fe(0) addition no migration could be measured ($D_a < 2x10^{-16}$ m^2/s) while in the case of Cu(I) the effect is not so pronounced. ($D_a = 2x10^{-11}$ m^2/s) U and Np show the same trend. For plutonium no diffusion can be measured in the time scale used. For the minerals no change in diffusion rate was achieved in the case of 1% addition of the minerals. However, for Tc with addition of 10% of the minerals and long preequilibration time, especially for magnetite and fracture fillings, indication of reduction is pronounced. Further experiments with Pu are still in progress due to long contact times.

51716 **Horizontal wells for in-situ remediation of groundwater and soils.** Kaback, D.S. (E.I. du Pont de Nemours and Co., Aiken, SC (USA)); Looney, B.B.; Corey, J.C.; Steele, J.L.; Wright, L.M. III. pp. 121-135 of The proceedings of the third national outdoor action conference on aquifer restoration, ground water monitoring and geophysical methods. National Water Well Association, Dublin, OH (US) (1989). pp. 1161 (CONF-8905127–: 3. National Water Well Association outdoor action conference, Orlando, FL (USA), 22-25 May 1989).

Two horizontal wells were installed adjacent to an abandoned process sewer line at the Savannah River Plant. Documented leaks from the process sewer have contaminated the underlying vadose zone and ground water with volatile organic compounds. The wells were installed to test new methods of in-situ remediation of soils and ground water. A deep horizontal well, installed below the water table, is to be used as an air-injection well to strip volatile organics from the contaminated ground water. The shallow horizontal well, installed in the vadose zone, is to be used to remove vapor-phase volatile organic compounds from the vadose zone and to recover the organics purged from the ground water.

51717 **Energy and radiative precursor emissions.** Edmonds, J.A. (Pacific Northwest Laboratory, Washington, DC (US)); Wuebbles, D.L.; Scott, M.J. pp. 353-370 of Environmental problems and solutions: Greenhouse effect, acid rain, pollution. Veziroglu, T.N. Hemisphere Publishing, New York, NY (USA) (1990). pp. 525

This paper discusses the timing and magnitude of climatic change, the greenhouse issue, which depends on both man-made emissions and natural processes. Energy production, transformation, end-use and conservation are associated with emissions of many of the key radiatively important gases (RIG's). The authors

address the link between energy use and Co_2. Scenarios of future atmospheric composition sued in climate studies are studied. Crude calculations are presented to examine the potential uncertainty with regard to radiative forcing which could be narrowed by further research in the areas of endogenous emissions and atmospheric chemistry.

51718 **Chemical confinement systems for waste disposal.** Rivera, A.L. (Oak Ridge National Laboratory, TN (USA)); Jolley, R.L. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 30(1): 61-64 (1990). (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

The overall objective of waste disposal systems is for long-term isolation of the waste. A waste confinement system can be developed as a three-step management strategy: (1) waste processing and packaging prior to disposal with the objective of immobilizing the contaminant, (2) selection and construction of engineered barriers to prevent or control the migration of the contaminant from the disposal unit, and (3) selection of a disposal site having appropriate hydrogeolic properties with the objective of using natural barriers to control the migration of waste contaminant from the disposal facility.

51719 **Transport of dissolved organic matter and polychlorinated biphenyls in soil columns.** Dunnivant, F.M. (Oak Ridge National Laboratory, TN (USA)); Jardine, P.M.; Taylor, D.T.; McCarthy, J.F. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 30(1): 407-410 (1990). DOE Contract AC05-84OR21400. (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

Numerous investigations have shown that naturally-occurring dissolved organic matter (DOM) increases the apparent solubility of hydrophobic pollutants, such as polychlorinated biphenyls (PCBs). Recently, groundwater surveys have documented the enhanced transport of contaminants as compared to equilibrium convective dispersive model predictions. The purpose of this investigation was to experimentally determine the transport of dissolved organic material (DOM) in laboratory soil columns and evaluate the hypothesis of co-transported hydrophobic contaminants.

51720 **Mourning dove use of man-made ponds in a cold-desert ecosystem in Idaho.** Howe, F.P. (South Dakota State Univ., Brookings (USA)); Flake, L.D. *Great Basin Naturalist (USA),* 49(4): 627-631 (31 Oct 1989).

Mourning doves (Zenaida macroura) in a cold-desert ecosystem used man-made ponds for watering, feeding, gritting, loafing, and courting. Diurnal pond use by doves peaked in the morning and evening. Monthly dove use of ponds fluctuated slightly during the summers of 1984 and 1985. Pond size, pH, and shoreline characteristics had little association with the intensity of pond use by doves; but geographic isolation of ponds was weakly associated had pond-use intensity. The number of doves present at the beginning of the one-hour period was a poor indicator of the number of arrivals during that period. We conclude that man-made water sources are important in areas where water availability may limit mourning dove productivity and abundance. It is suggested that mourning dove arrival rates could be used as a population index in cold-desert areas.

51721 **Persistence and distribution of PCBs in the sediments of a reservoir (Lake Hartwell, South Carolina).** Dunnivant, F.M. (Oak Ridge National Laboratory, TN (USA)); Polansky, A.L.; Elzerman, A.W. *Bulletin of Environmental Contamination and Toxicology (USA),* 43(6): 870-878 (Dec 1989).

PCBs are one of the most persistent and ubiquitous pollutants occurring in the environment today. Since their release to the environment, PCBs have been found in water, air, soil, sediment, and human samples. Low levels are now identifiable even in remote sites. Once in aquatic systems, PCBs tend to associate with particulate matter which may subsequently settle to the bottom. Thus, lake and river sediments have been found to be a major PCB sink in aquatic systems, as observed for the reservoir system studied here. Lake Hartwell is a PCB-contaminated reservoir located in the upper Savannah River basin in South Carolina and Georgia. It has received the majority of the PCB contamination from Twelve-Mile River, a major tributary at the top of the reservoir located in the northwestern portion of South Carolina in Pickens County. The purpose of this investigation was to provide information on the lake-wide fate and distribution of PCBs and effects of natural and anthropogenic redistribution processes. Although congener-specific data were generated, space for only total PCB concentrations is available here.

51722 (AD-A–223438/3/XAB) **Installation-Restoration Program Stage 5. Informal technical information report, analytical data summary. Preliminary pathways assessment - surface-water and stream-sediment samples. Final report, January 1989-March 1990.** Radian Corp., Sacramento, CA (USA). 17 May 1990. 178p. Contract F33615-87-D-4023. Source: NTIS, PC A09/MF A01.

This letter report presents the analytical results and data evaluation for surface water and stream sediment sampling performed at McClellan AFB in January and February, 1989. Results are also provided from a geophysical investigation that was performed to locate possible underground storage tanks at five locations on McClellan AFB. All work was performed in accordance with the Draft Preliminary Pathways Assessment Work Plan, September 1988. Information obtained during this preliminary investigation, indicates that manufactured organic compounds and metals exist in some of the creeks and drainages at McClellan AFB. The data indicate that low-level contamination potentially originates from both on-base and off-base sources. Results from the geophysical investigation indicated a low probability of having underground storage tanks at three locations. Two of the five locations investigated were identified as having a high probability of having underground tanks.

51723 (ANL/EAIS/TM–28) **Hydrological conditions at the 317/319 Area at Argonne National Laboratory.** Patton, T.L.; Pearl, R.H.; Tsai, S.Y. Argonne National Lab., IL (USA). Environmental Assessment and Information Sciences Div. Aug 1990. 89p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE91000099. Source: NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This study examined the hydrological conditions of the glacial till underlying the 317/319 Area at Argonne National Laboratory (ANL) near Lemont, Illinois. The study's purpose was to review and summarize hydrological data collected by ANL's Environment, Safety, and Health Department and to characterize, based on these data, the groundwater movement and migration of potential contaminants in the area. Recommendations for further study have been made based on the findings of this review. The 317/319 Area is located between Meridian Road and the southern border of ANL. The 317 Area was commissioned in the late 1940s for the temporary storage of radioactive waste. Low- and high-level solid radioactive waste is stored in partially buried concrete vaults. Low-level radioactive waste awaiting shipment for off-site disposal is stored in aboveground steel bins north of the vaults. The 319 Area is an inactive landfill, located east of the 317 Area that was used for the disposal of general refuse, demolition debris, and laboratory equipment. Fluorescent light bulbs, chemical containers, and suspect waste were also placed in the landfill. Liquid chemical wastes were disposed of at each site in gravel-filled trenches called "French drains." The 317/319 Area is underlain by a silty clay glacial till. Dolomite bedrock underlies the till at an average depth of about 19.5m. Organic contaminants and radionuclides have been detected in groundwater samples from wells completed in the till. Fractures in the clay as well as sand and gravel lenses present in the till could permit these contaminants to migrate downward to the dolomite aquifer. At the time of this report, no chemical quality analyses had been made on groundwater samples from the

dolomite. The study found that existing information about subsurface characteristics at the site is inadequate to identify potential pathways for contaminant migration. 14 refs., 13 figs., 6 tabs.

51724 (ANL/EAIS/TM–29) **Hydrological conditions at the 800 Area at Argonne National Laboratory.** Patton, T.L.; Pearl, R.H.; Tsai, S.Y. Argonne National Lab., IL (USA). Environmental Assessment and Information Sciences Div. Aug 1990. 113p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE91000100. Source: NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This study examined the hydrological conditions of the glacial till underlying the 800 Area sanitary landfill at Argonne National Laboratory (ANL) near Lemont, Illinois. The study's purpose was to review and summarize hydrological data collected by ANL's Environment, Safety, and Health Department and to characterize, on the basis of these data, the groundwater movement and migration of potential contaminants in the area. Recommendations for further study have been made based on the findings of this review. The 800 Area landfill is located on the western edge of ANL, just south of Westgate Road. It has been in operation since 1966 and has been used for the disposal of sanitary, general refuse. From 1969 through 1978, however, substantial quantities of liquid organic and inorganic wastes were disposed of in a "French drain" at the northeast corner of the landfill. The 800 Area landfill is underlain by a silty clay glacial till. Dolomite bedrock underlies the till at an average depth of about 45.6 m. Trace levels of organic contaminants and radionuclides have been detected in groundwater samples from wells completed in the till. Fractures in the clay as well as sand and gravel lenses present in the till could permit these contaminants to migrate downward to the dolomite aquifer. When this report was prepared, no chemical quality analysis have been made on groundwater samples from the dolomite. The study found that existing information about subsurface characteristics at the site is inadequate to identify potential pathways for contaminant migration. Recommended actions include installation of five new well clusters and one background well, thorough record-keeping, sample collection and analysis during borehole drilling, slug testing to measure hydraulic conductivity, topographic mapping, continued monitoring of groundwater levels and quality, and monitoring of the unsaturated zone. 17 refs., 13 figs., 4 tabs.

51725 (CONF-9005271–1) **USDOE applied R&D private sector initiatives.** Lien, S.C.T. (USDOE Office of Environmental Restoration and Waste Management, Washington, DC (USA). Office of Technology Development); Borys, S.S.; Erickson, M.D. Argonne National Lab., IL (USA). [1990]. 13p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract W-31109-ENG-38. From 1990 conference on hazardous waste research; Manhattan, KS (USA); 21-22 May 1990. Order Number DE90017658. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The Department of Energy (DOE) has recently consolidated its Environmental Restoration and Waste Management activities. Within that new organization, DOE has committed to conduct Research, Development, Demonstration, Testing, and Evaluation (RDDT&E) activities within the Office of Technology Development (OTD) to reduce cost, reduce risk, and otherwise improve the technologies to meet its cleanup goals. Currently available technology is not adequate to assess environmental contamination, take permanent remedial action, and to eliminate or minimize the environmental impact of future operations. To focus private sector capabilities on the high-priority needs of DOE, a series of competitive solicitations will be issued starting in FY 1990. This paper describes the range and scope of the DOE initiatives for private sector involvement in Applied R&D. 2 tabs.

51726 (CONF-9009254–1) **Calibration of groundwater flow models using Monte Carlo simulations and geostatistics.** Hoeksema, R.J. (Calvin Coll., Grand Rapids, MI (USA)); Clapp, R.B. Oak Ridge National Lab., TN (USA). [1990]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From International conference on calibration and reliability in groundwater modeling; Hague (Netherlands); 3-6 Sep 1990. Order Number DE90017737. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Groundwater flow models require specification of several input parameter fields which are inferred from limited data. In this paper the hydraulic conductivity and recharge rate are estimated for an unconfined aquifer under steady flow conditions. Usually point observations of conductivity and head are available for the estimation of the distributed conductivity field and the recharge rate. Use of numerical flow models require that these fields be prescribed as average values over finite elements. The geostatistical solution to this problem uses linear estimation to obtain the distributed conductivity field and the recharge rate. Monte Carlo simulations are used here to compute the covariances associated with the head data. Results obtained for both artificial and real data show that the head data is effective in improving the estimates that would result using conductivity data alone. The use of Monte Carlo simulations results in a method which can be used under a wider variety of modeling conditions than previous applications of the geostatistical approach. 11 refs., 2 figs.

51727 (DOE/ER/60269–T2) **Coordination for the OHR/ERD R4D program: Final report.** Kelley, J.J. Alaska Univ., Fairbanks, AK (USA). Inst. of Marine Science. May 1990. 567p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-84ER60269. Order Number DE90015523. Source: NTIS, PC A24/MF A01 - OSTI; GPO Dep.

This report is a final report for Grant No. FG06-84ER-60269. This project provided coordination in the field for the R4D projects and climatological services. It consisted of: scheduling and logistics coordination services, Liaison services with industry, government and academic institutions, and Technical Services in the field as requested (regional climatology, atmospheric particulate input). A research site was chosen in summer 1984 as the intensive watershed research area for the R4D program. This research site is on TransAlaska pipeline corridor property (MS-117) permitted to the Alyeska Pipeline Company by the US Bureau of Land Management. Permission to enter this land for the purpose of carrying out scientific research requires permission from a variety of state and federal agencies and the local government. Permission to use the material site (MS-117) was granted by the Alyeska Pipeline Company.

51728 (DOE/ER/60850–1) **[The role of natural organic matter in the partitioning and transport of polynuclear aromatic hydrocarbons in groundwater]: Progress report.** Colorado Univ., Boulder, CO (USA). [1990]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER60850. Order Number DE91000826. Source: NTIS, PC A01/MF A01; OSTI; INIS; GPO Dep.

A general summary of our progress associated with batch and column experiments is included in this report. During the period of July 1, 1989 through the present, we have emphasized batch experiments to study the partitioning between one PAH, phenanthrene, and each of two sources of groundwater natural organic matter (NOM) in the presence and absence of a model mineral surface (a-Al_2O_3). The behavior of a soil-derived fulvic acid sorbed to the mineral surface has also been investigated. The NOM sources were used as "bulk" (unfractionated) and fractionated into different molecular weight (MW) fractions by ultrafiltration (UF), and into humic and non-humic fractions by XAD-8 resin adsorption. Three techniques have been evaluated for differentiating between aqueous PAH and NOM-bound PAH: fluorescence quenching (FQ), reverse phase (Sep-Pak) separations, and dialysis bags. We have conducted batch experiments to study the three binary systems; PAH-NOM, PAH-a-Al_2O_3, and NOM-a-Al_2O_3; and the ternary system, PAH-NOM-a-Al_2O_3. Sorption of NOM onto a mineral surface, alumina, has been evaluated from the perspective of providing a model of soil organic matter.

51729 (DP-MS–88-169) **Wetlands mapping with spot multispectral scanner data.** Mackey, H.E. Jr. (Savannah River Lab., Aiken, SC (USA)); Jensen, J.R. Savannah River Lab., Aiken, SC (USA). [1989]. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-76SR00001. (CONF-8904117–2: American Society for Photogrammetry and Sensing/American Congress on Surveying and Mapping Auto-Carto 9 annual convention, Baltimore, MD (USA), 2-7 Apr 1989). Order Number DE91000780. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Government facilities such as the US Department of Energy's Savannah River Plant (SRP) near Aiken, South Carolina, often use remote sensing data to assist in environmental management. Airborne multispectral scanner (MSS) data have been acquired at SRP since 1981. Various types of remote sensing data have been used to map and characterize wetlands. Regional Landsat MSS and TM satellite data have been used for wetlands mapping by various government agencies and private organizations. Furthermore, SPOT MSS data are becoming available and provide opportunities for increased spacial resolution and temporal coverage for wetlands mapping. This paper summarizes the initial results from using five dates of SPOT MSS data from April through October, 1987, as a means to monitor seasonal wetland changes in freshwater wetlands of the SRP. 11 refs., 4 figs.

51730 (FO/CAR–779) **Marine ichthyoplankton data from the Canadian Beaufort Sea Shelf, July and September 1984.** Canadian data report of fisheries and aquatic sciences, No. 779. Chiperzak, D.B.; Hopky, G.E.; Lawrence, M.J.; Lacho, G. Canadian Pulp and Paper Association, Montreal, PQ (Canada). Technical Section. Feb 1990. 53p. (MICROLOG–90-04052). Source: PC Fisheries and Oceans Canada, Scientific Publications, 200 Kent St, 14th Floor, Ottawa, ON, CAN K1A 0E6; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

As part of the Beaufort Shelf Fish Habitat Research Subproject of the Northern Oil and Gas Action Program, ichthyoplankton were collected from 760 μm Wiscosin net and 500 μm neuston net plankton tows in July and September of 1984 along the Canadian Beaufort Sea Shelf. A total of 1408 larval fish representing six families and nine species groups were caught in the 34 plankton tows. Arctic cod (Boreogadus saida) was the most abundant larval fish species caught both in the Wisconsin and neuston tows. Standard length, total length, and wet-weight measurements were made on 1123 larval fish of which 1097 were Arctic cod. The July mean standard length for Arctic cod was 13.4 mm with a standard deviation of 2.7 mm, and a mean weight of 0.015 g with a standard deviation of 0.010 g. In September, Arctic cod mean standard length was 26.3 mm, standard deviation of 3.8 mm, and the mean weight was 0.130 g with a standard deviation of 0.058 g. A total of 126 fish were analyzed for stomach contents of which four were found to be empty. Copepods were the most frequently occurring food item in all four species groups analysed with Calanoida being the most frequently occurring and the most abundant food item for both B. saida and the fourhorn sculpin, Myoxcephalus quadricornis. Nine stomachs, all from B. saida, contained the parasite (Trematoda: Hemiuridae). 10 refs., 2 figs., 25 tabs.

51731 (FO/S–1171) **A survey of dilute lakes on the south coast of insular Newfoundland in relation to natural and anthropogenic acidification.** Canadian techical report of fisheries and aquatic sciences, No. 1711. Scruton, D.A.; Taylor, D.H. Department of Fisheries and Oceans, St. John's, NF (Canada). Science. Oct 1989. 67p. (MICROLOG–90-04323). Source: PC Fisheries and Oceans Canada, Scientific Publications, 200 Kent St, 14th Floor, Ottawa, ON, CAN K1A 0E6; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

In July 1983, a synoptic survey of the water chemistry of 90 lakes on the south coast of insular Newfoundland was undertaken to address sensitivity to and effects from the long range transport of air pollutants. Study lakes were characterized by very low alkalinities and acidic pH values. Lakes ranged from clear to high colored. Lake (excess) sulphate levels were also low, while organic anion levels range widely. Lake acidity reflected the inputs of both anthropogenic and natural acids. The dilute and acid-sensitive nature of the south coast lakes was confirmed by various sensitivity indices. A deficit in alkalinity was apparent in all but 2 lakes. A plot of south coast data on Henriksen's empirical acidification models suggests that most lakes showing acidification effects are strongly influenced by natural organic acidity. The acid-base balance in lakes in the southwest was more clearly related to anthropogenic sulfate levels. Both models are considered poor in their application to south coast lakes due to the preponderance of weak (organic) acid dominated systems. The ratios of alkalinity to excess Ca and Mg, excess sulfate to excess Ca and Mg, and alkalinity to excess sulfate for the study lakes provides further evidence of extreme sensitivity to acidification. The Wright-Henriksen acidification equation was used to predict pH/alkalinity values for the study lakes. This model suggested a 50% increase in sulfate deposition could result in 32% of south coast lakes becoming acidified, while a doubling of current sulfate deposition rates could result in 64% of those lakes becoming acidified. 107 refs., 16 figs., 7 tabs.

51732 (GKSS–89/E/54) **The settling velocity of suspended solid matter in the river Elbe at Lauenburg and Buntheus, August 1989.** Puls, W. (GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany, F.R.). Inst. fuer Physik); Kuehl, H. GKSS-Forschungszentrum Geesthacht GmbH, Hamburg (Germany, F.R.). 1989. 43p. (In German). Order Number DE91706218. Source: NTIS (US Sales Only), PC A03/MF A01.

In August 1989 the settling velocity and the concentration of suspended solid matter was measured in the Elbe river at Bunthaus and Lauenburg by using an Owen-tube. The fluvial discharge of the Elbe river in summer 1989 was less than 300 m^3/s which is an extremely low value. The aim of the measurements was to investigate the characteristics of suspended matter at this low fluvial discharge. The results show that the settling velocities were not extreme, but that the suspended matter concentrations were above avarage. In the storage lake near Geesthacht the suspended matter concentration at the water surface decreased from Lauenburg to the weir by about 75%. (orig.) With 18 figs.

51733 (GKSS–89/E/60) **Settling velocity measurements of mud flocs in the river Ems, comparison with measurements in the river Elbe.** Schulze, M. (Technische Univ. Braunschweig (Germany, F.R.). Leichtweiss-Institut fuer Wasserbau); Puls, W.; Kuehl, H. GKSS-Forschungszentrum Geesthacht GmbH, Hamburg (Germany, F.R.). 1989. 25p. (In German). Order Number DE91706217. Source: NTIS (US Sales Only), PC A03/MF A01.

In the region of brackish water in the Ems-estuary near the village of Gandersum, the settling velocity of mud flocs was measured during the tidal cycle. The settling velocity was found to be approximately proportional to the concentration of suspended matter. The data had no correlation between the settling velocity and the water salinity. The settling velocity of flocs in the Elbe-, Weser-, and Thames-estuary is essentially lower compared to the settling velocity of mud flocs in the Ems-estuary. (orig./HK) With 13 figs., 1 tab.

51734 (IWD/AR/WQB–89-152) **Major ion dynamics of surface waters of varying hydrologic order.** Howell, G. Inland Waters Directorate, Moncton, NB (Canada). Water Quality Branch. [1989]. 143p. (MICROLOG–90-03147). Source: PC Environment Canada, Departmental Library, Ottawa, ON, CAN K1A 0H3; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

The seasonal patterns of major ion chemistry for eight streams and two lakes situated in the vincinity of Kejimkujik National Park (Nova Scotia) are considered. Sulphate concentrations exhibit the same seasonal pattern in all the systems investigated with minima occurring during the summer and maxima occurring during the late winter, early spring. Comparison of atmospheric deposition with river export indicates that sulphate in these systems is predominantly from atmospheric supply as annual wet sulphate deposition can account for approximately 80% of the annual river sulphate export. However, there is strong seasonal cycling in these systems with sulphate being retained from May to November and lost from December to April. The dissolved organic carbon (DOC) seasonal patterns in these systems are highly variable. The low order streams have DOC maxima during the late summer and fall and minima during late spring. The much higher order river have DOC maxima during the winter and minima during late spring and early summer. Other terrestrially derived variables (calcium, magnesium and silica) exhibit similar seasonal patterns. The patterns of DOC and sulphate observed indicate that both mineral and organic acids are important in the acidification of these systems. In the low order streams mineral acids dominate during the spring while organic acids dominate during the summer. In the higher order systems

there is no clear cut seasonal dominance of either organic or mineral acids. However, major changes in pH in these systems tend to be associated with changes in sulphate concentrations rather than in DOC concentrations. 51 refs., 66 figs., 3 tabs.

51735 (KFK–4689) **Automated water analysis for the determination of calcium, magnesium, sulfate, carbonate, phosphate and ammonia by potentiometric titration techniques.** Hoefert, N. Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Inst. fuer Radiochemie; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Chemie. Apr 1990. 125p. (In German). Order Number DE91705961. Source: NTIS (US Sales Only), PC A06/MF A01.

An automated process was developed, which allows the determination of the concentrations of calcium, magnesium, sulfate, carbonate, phosphate and ammonia in aqueous solutions by potentiometric titration techniques. The apparatus consists of a titrator, which controls five automatic burettes (HCl, NaOH, Na_4EGTA, Na_4EDTA, $BaCl_2$/acetyl-acetone) and two magnetic valves. The titration data and additional data are read by a pH-electrode, a calcium-selective electrode in combination with a calomel reference-electrode, a conductivity cell and a resistance thermometer. A parallel interface connects the titrator to a computer, which processes the data by means of a BASIC-programme. The concentrations of carbonate, phosphate and ammonia are determined by acid-base titrations, in this case by end-point titrations to predetermined pH-values. It was shown that by this method it is possible in principle to determine the three constituents simultaneously. For reasons of precision it is advantageous to separate the titrations in such a way that the titration-points necessary for the determination of carbonate are firstly determined. Then the carbonate is removed as CO_2 by reducing the pH and bubbling argon through the solution. Secondly the titration-points necessary for the determination of phosphate and ammonia are taken by titration with NaOH. In presence of calcium and magnesium ions a complexing agent has to be added before the titration is carried out, in order to prevent the precipitation of calcium and magnesium salts at higher pH-values. EDTA and EGTA were used for this purpose. (orig.).

51736 (MUN/CCORE–90-04218) **Five year research plan, 1990-1994.** Memorial Univ. of Newfoundland, St. John's, NF (Canada). Centre for Cold Ocean Resources Engineering. [1989]. 20p. (MICROLOG–90-04218). Source: PC Centre for Cold Ocean Resources Engineering, C-CORE, Memorial University of Nfld., St. John's, NF, CAN A1B 3X5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

The Centre for Cold Ocean Resources Engineering is an independently funded research institute involved in solving engineering problems related to resource development in cold oceans. The Centre undertakes research ice engineering, remote sensing, and seabed geotechnics. This 5-year research plan describes activities in each of these 3 areas for the next 5 years and identifies new initiatives or changes of emphasis from the past plan. The centre has increased its emphasis on ice management, particularly in relation to the organization and handling of ice data and ice forecasting. In addition, environmental issues have been given increased importance, particularly those relating to the effect of global warming in northern waters, and oil spills in pack ice. Areas of new research in seabed geotechnics include environmental monitoring/assessment, bio-acoustics, artificial intelligence, geographical information processing and field applications of the Acoustic Sub-seabed Interrogator concept. Research in remote sensing will focus on ice and iceberg hazard detection systems which can be placed on structures and vessels. 3 figs.

51737 (OE–90-04766) **The acidification of Ontario lakes: An assessment of their sensitivity and current status with respect to biological damage.** Ontario Ministry of the Environment, Toronto, ON (Canada). Jan 1990. 188p. (MICROLOG–90-04766). Source: PC Ontario Ministry of the Environment, Public Information Centre, 135 St. Clair Ave. West, Toronto, ON, CAN M4V 1P5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

This report provides an update of the acid sensitivity data on lakes in Ontario, documents the analytical methods and data sources, and provides estimates for some areas of the province of the total number of lakes in various pH and alkalinity classes, which are interpreted in terms of the aquatic resources at risk in the province. It was concluded that atmoshperic deposition of sulphate is the major source of sulphate in Ontario lakes, and is strongly correlated with significant reduction of pH and acid neutralizing capacity in low-ionic strength lakes. There are at least 19,000 lakes in Ontario estimated to have been acidified to the point ($pH \leq 6.0$) where adverse biological effects have occurred. Also, the majority of the acidified lakes (over 11,000) are in central Ontario, where total annual sulphur deposition exceeds 0.75 gS $m^{-2}yr^{-1}$. This deposition region includes Haliburton, Muskoka, Parry Sound, Nipissing, Timiskaming, Sudbury and Algoma. A large number of the acidified (7,300) lakes are in the Sudbury area, and have been acidified primarily by past sulphur emissions from the Sudbury smelters. There are at least 7,250 lakes in Ontario estimated to be very acidic, with all of their acid neutralizing capacity eliminated ($alkalinity \leq 0$). In conclusion, acidification due to natural organic acids is not a major factor in explaining the acidification of lakes. 39 refs., 44 figs., 71 tabs.

51738 (OE/RT–90-03626-Vol.1, pp. 414-416, Paper BP4) **The origin and distribution of methane in the Alliston aquifer complex, southern Ontario.** Aravena, R. (Dept. of Earth Sciences Univ. of Waterloo, Waterloo, ON (Canada)); Wassenaar, L.; Barker, J.; Gillham, R. Ontario Ministry of the Environment, Toronto, ON (Canada). Research and Technology Branch. 1989. (CONF-8911230–: Environmental research: technology transfer conference, Toronto (Canada), 20-21 Nov 1989; MICROLOG–90-03626). Source: PC Publications Ontario, 880 Bay St, 5th Floor, Toronto, ON, CAN M7A 1N8; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

Methane is a major ground water contaminant in some parts of the Alliston aquifer complex. This paper attempts to establish the distribution pattern of methane and to provide a reasonable model for the origin and prediction of methane in the aquifier. The research approach includes the use of geological, hydrological and geochemical tools. An extensive groundwater sampling program that includes deep overburden and bedrock wells, representing most of the aquifer, has been carried out in order to evaluate the distribution of methane and geochemistry of groundwater in the aquifer. Results indicate that methane in the aquifer is formed by microbial processes and is not thermocatalytic. The nature of the Paleozoic bedrock does not control the distribution of methane in the aquifer. Methane and dissolved organic carbon appear to be linked to a common organic rich carbon source present in some parts of the aquifer. Some parts of the aquifer contain very old groundwater that was recharged under cooler conditions than at present or reflected the input of glacial meltwater.

51739 (OE/RT–90-03626-Vol.1, pp. 460-462, Paper BP19) **Carbon, sulfur, and nitrogen cycling in three unconfined aquifer systems in Ontario.** Wassenan, L.I. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

This paper evaluates the origin, fluxes, and geochemistry of soluble organic matter in three shallow sand aquifers located near Rodney, Alliston and Sturgeon Falls, as well as the role of naturally

occurring soluble organic matter (DOC) in microbially mediated redox processes that affect the various carbon, nitrogen and sulfur pools. Based on $\delta^{34}S$ analyses of aqueous sulfate, it was concluded that sulfate at Sturgeon Falls and Alliston is derived from acid rain deposition, whereas at Rodney additional sulfate is derived from oxidation of organic bound and/or mineral sulfur. The nitrate at Rodney and Alliston is derived from fertilizers and agricultural practices. Bacterial remediation occurs at Rodney and Sturgeon Falls, but not at Alliston. Data show that high molecular weight (HMW) soluble organic matter at Rodney is rapidly flushed to the groundwater during recharge from the upper few centimeters of the soil profile in less than 2 years. The HMW DOC is composed of a mixture of old and young carbon, having a mean residence time of 600 years. Low molecular weight DOC has ages similar to the aquifer kerogen, suggesting a link between the aqueous and solid organic carbon pools. In the Sturgeon Falls aquifer HMW DOC entering the groundwater indicates soluble organic matter has residence times less than 30 years, and is recharged to the system in less than 1-2 years. Data also indicate labile organic carbon may also be produced by fermenting bacteria acting on kerogen indigenous to the aquifer material. At the Alliston site, a long residence time for soluble organic matter in the vadose zone is postulated due to a thick unsaturated zone, resulting in refractory, nonlabile DOC reaching the groundwater.

51740 (OE/RT–90-03626-Vol.1, pp. 417-419, Paper BP5) **Microbial methylation of mercury in acid stressed lakes: Role of sulphate reducing bacteria.** Kerry, A. (BIOS Environmental Research, Toronto, ON (Canada)); Stokes, P.M.; Prucha, B.; Mierle, G. Ontario Ministry of the Environment, Toronto, ON (Canada). Research and Technology Branch. 1989. (CONF-8911230–: Environmental research: technology transfer conference, Toronto (Canada), 20-21 Nov 1989; MICROLOG–90-03626). In *Proceedings [of the] Environmental research: Technology transfer conference: Volume 1. Feature presentations, air quality research, water quality research.* 486p. Source: PC Publications Ontario, 880 Bay St, 5th Floor, Toronto, ON, CAN M7A 1N8; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC PRICES UPON REQUEST; MF $10 CAN.

Methylation of mercury by microorganisms produces a form of mercury that is more toxic and more biologically available to biota than is inorganic mercury. Microbial communities in lake sediment are known to methylate inorganic mercury and logically, factors which change or stimulate portions of this community can influence the rate of methylation. The increased input of sulphate from acidic deposition may stimulate sulphate-reducing bacteria over the other sediment populations thereby potentially increasing the rate of methylmercury production in the system. The role of freshwater sulphate-reducing bacteria from the Muskoka-Haliburton area (Dickie Lake, pH 5.7) in methylmercury production was examined by adding specific microbial inhibitors to anoxic lake sediments spiked with $^{209}HgCl_2$. The effect of increased sulphate activity of sulphate-reducing bacteria both in terms of sulphate reduction rate and methylation of mercury was examined by adding appropriate ranges of concentrations of sulphate to $^{209}HgCl_2$ spiked sediment. It was found that sulphate-reducing bacteria do appear to be major methylators of mercury in freshwater, anoxic sediments and were more important in this respect than methanogens. However, the stimulatory effect of sulphate, within normal levels, on these bacteria's ability to further methylate mercury remains unclear. 20 refs., 2 figs.

51741 (OH/RD–89-276-K) **Atikokan TGS [thermal generating station] aquatic studies, 1981 to 1988.: 2. Water chemistry.** Haymes, G.T. Ontario Hydro, Toronto, ON (Canada). Research Div. 24 Nov 1989. 45p. (MICROLOG–90-03529). Source: PC Ontario Hydro Research Division, Records Clerk, Bldg. KR 107, 800 Kipling Ave., Etobicoke, ON, CAN M8Z 5S4; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, ON, CAN K1A 0G1.

Comparison of chemical data collected prior to and during the operation of the Atikokan Thermal Generating Station indicated that changes in many chemical parameters were a reflection of the relocation of water through the station from Moose and Marmion Lakes into Snow, Icy and Abie Lakes. This trend was most apparent for conservative parameters such as alkalinity, calcium, chloride, dissolved solids and hardness but for more dynamic parameters such as total phosphorus the trend was only apparent when the station was consistently operating. pH levels increased after 1981, but this appeared to be a general phenomenon unrelated to station operation or construction. Most hypothesized effects of station operation on water chemistry were considered incorrect due to the substantial influence of water relocation on the chemistry of the lakes. With the exception of iron, the the frequency of exceedances of provincial water quality objectives did not increase during operation of the station. 16 refs., 11 figs., 9 tabs.

51742 (ORNL/FTR–3747) **[International meetings on ecology]: Foreign trip report, August 16, 1990–September 4, 1990.** DeAngelis, D.L.; Garten, C.T. Jr.; Turner, M.G. Oak Ridge National Lab., TN (USA). 25 Sep 1990. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE91000700. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

the travelers attended the Fifth International Congress of Ecology (INTECOL) in Yokohama, Japan, and two presented invited papers and chaired symposia. One traveler also attended the OJI International Seminar in Gifu, Japan and the Fukuoka Symposium on Theoretical Ecology in Fukuoka, Japan and presented invited papers. At these scientific gatherings, a large number of symposia and specific presentations were relevant to current research at Oak Ridge National Laboratory (ORNL), especially in the areas of landscape dynamics, plant physiology, and aquatic ecosystems.

51743 (PB–90-252594/XAB) **Emerging technologies: Bio-Recovery Systems removal and recovery of metal ions from ground water.** Darnall, D.W.; Hosea, J.M. Bio-Recovery Systems, Inc., Las Cruces, NM (USA). Aug 1990. 55p. Source: NTIS, PC A04/MF A01.

See also Appendices, PB–90-252602.

A series of laboratory tests and an on-site pilot scale demonstration of Bio-Recovery Systems' AlgaSORB technology for the removal and recovery of mercury-contaminated groundwater were conducted under the SITE program. Optimum conditions were determined for mercury binding to AlgaSORB. Conditions under which mercury could be stripped from AlgaSORB were developed. On-site, pilot scale demonstrations with a portable waste treatment system incorporating columns containing two different AlgaSORB preparations confirmed laboratory tests. Over 500 bed volumes of mercury-contaminated groundwater could be successfully treated before regeneration of the system was required. Mercury was removed to levels below the discharge limit of 10 microgram/L.

51744 (PB–90-252602/XAB) **Emerging technologies: Bio-Recovery Systems removal and recovery of metal ions from ground water. Appendices.** Darnall, D.W.; Hosea, J.M. Bio-Recovery Systems, Inc., Las Cruces, NM (USA). Aug 1990. 118p. Source: NTIS, PC A06/MF A01.

Now in its fourth year, the Superfund Innovative Technology Evaluation (SITE) Program is part of EPA's research into cleanup methods for hazardous waste sites around the nation. Through cooperative agreements with developers, alternative or innovative technologies are refined at the bench-and pilot-scale level and then demonstrated at actual sites. EPA collects and evaluates extensive performance data on each technology to use in remediation decision-making for hazardous waste sites. The appendices include the laboratory analysis results from two independent laboratories that were provided split samples from two Bio-Recovery Systems, Inc. during the on-site pilot testing of Bio-Recovery's technology f or the removal of mercury from contaminated groundwaters during the period of November 7, 1989 to December 1, 1989.

51745 (PB–90-253626/XAB) **Health assessment for Jones Industrial Services Landfill, South Brunswick Township, Middlesex County, New Jersey, Region 2. CERCLIS No. NJD097400998. Final report.** New Jersey State Dept. of Health, Trenton, NJ (USA). 30 Jul 1990. 15p. Source: NTIS, PC A03/MF A01.

See also PB–90-139130.

The Jones Industrial Landfill site began as a 33-acre pit that had been excavated to provide soil needed during the construction of the New Jersey Turnpike. Landfilling operations reportedly began in 1955. In the 1960's, as part of the landfilling operation, toxic chemicals were dumped into the pit. The site is currently ranked 45 of 110 Superfund sites in New Jersey. The primary pathway of concern is the domestic use of contaminated groundwater. Residents near the JIS landfill have experienced contamination of their well water since 1975. On-site contamination of groundwater and soil has occurred predominantly by volatile organic compounds (VOCs), pesticides and heavy metals. On the basis of the information reviewed, ATSDR and NJDOH have concluded that the site is of public health concern because humans have probably been exposed to VOCs, heavy metals, phthalates and pesticides at concentrations that may result in adverse health effects. The Jones Industrial Services Landfill site is being considered for appropriate follow-up health study and evaluation.

51746 (PB–90-256140/XAB) **Health assessment for Savage Municipal Well, Milford, Hillsborough County, New Hampshire, Region 1. CERCLIS No. NHD980671002 (amended). Preliminary report (Final).** New Hampshire Dept. of Health and Human Services, Concord, NH (USA). Environmental Health Risk Assessment Unit. 4 Apr 1990. 10p. Source: NTIS, PC A02/MF A01.

See also PB–90-137811.

The Savage Municipal Well Site is listed on the U.S. Environmental Protection Agency's (EPA) National Priorities List (NPL). The site consists of four industries within a half mile of the Savage Municipal Well. These industries have contributed to the contamination of groundwater, surface water and soils with volatile organic compounds (VOCs). The four industries identified as potentially responsible parties are Hendrix Wire and Cable Company, Inc., Hitchiner Manufacturing, Inc., New England Steel Fabricators, Inc., and O.K. Tool Company, Inc. (defunct). The site lies immediately south of the Souhegan River. Three hydrogeological investigations of contaminated areas have been conducted to date, including the hydrogeological study conducted by the NH WSPCC. The other two studies were separate company-initiated investigations of O.K. Tool and Hitchiner Manufacturing properties. Data from these studies were incorporated in the NH WSPCC report. Based on the available information, the Savage Well Site is considered to be of public health concern because of the risk to public health caused by prior exposure and potential future exposure to hazardous substances via the consumption of contaminated groundwater; direct contact with contaminated soils, surface water, and sediment; inhalation of contaminated soil and air; and incidental ingestion of contaminated soil, surface water, and sediment.

51747 (PB–90-256413/XAB) **Guides to pollution prevention: The printed-circuit-board manufacturing industry.** Jacobs Engineering Group, Inc., Pasadena, CA (USA). Jun 1990. 84p. Contract EPA-68-02-4286. Source: NTIS, PC A05/MF A01.

The guide identifies and analyzes waste minimization methodologies appropriate for the printed circuit board manufacturing industry. The wastes resulting from printed circuit board manufacturing are associated with five types of processes: cleaning and surface preparation; catalyst application and electroless plating; pattern printing and masking; electroplating; and etching. The wastes themselves include airborne particulates, spent acids and alkaline solutions, spent solvents, spent plating baths, waste rinsewater, and other wastes. The guide also presents a set of detailed waste minimization assessment worksheets suitable for use by shop managers and engineers, or by outside consultants, to formulate a waste minimization strategy for the particular plant. Finally, case histories of waste minimization assessments performed at three plants are given.

51748 (PB–90-256421/XAB) **Guides to pollution prevention: Selected hospital waste streams.** Jacobs Engineering Group, Inc., Pasadena, CA (USA). Jun 1990. 52p. Contract EPA-68-02-4286. Source: NTIS, PC A04/MF A01.

The hazardous wastes generated by general medical and surgical hospitals are small in volume relative to those of industrial facilities; however, the wastes are of a wide variety. Some of the hazardous materials used by hospitals that become part of their waste streams include chemotherapy and antineoplastic chemicals, solvents, formaldehyde, photographic chemicals, radionuclides, mercury, waste anesthetic gases; and other toxic, corrosive and miscellaneous chemicals. Additional wastes such as infectious waste, incinerator exhaust, laundry-related waste, utility wastes, and trash were not addressed in the guide. Reducing the generation of these materials at the source, or recycling the wastes on- or off-site, will benefit hospitals by reducing disposal costs and lowering the liabilities associated with hazardous waste disposal. The guide provides an overview of hospital waste generating processes and presents options for minimizing waste generation through source reduction and recycling.

51749 (PB–90-256579/XAB) **Radionuclide concentrations from waters of selected aquifers in Georgia. Technical report.** Coker, G.; Olive, R. Georgia Univ., Athens, GA (USA). Inst. of Ecology. 1989. 29p. Source: NTIS, PC A03/MF A01.

The report is part of the National Network for Environmental Management Studies under the auspices of the Office of Cooperative Environmental Management of the US Environmental Protection Agency. In 1988 the US Environmental Protection Agency, Region IV, began a pilot study to investigate the natural occurrence and concentration of Uranium 238, Thorium 232, and Uranium 235 radionuclide series in the ground water for selected aquifers in Georgia. Specific rock types, somewhat geologically homogeneous, were selected as representative of one or more aquifers for each of the geologic provinces in Georgia (Piedmont, Blue Ridge, Valley & Ridge, and Coastal Plain). Aquifers sampled within the Piedmont provinces included pre-Cambrian and Paleozoic granite/gneisses and granites from four Piedmont county areas (Gwinnett/Barrow, Greene, Elbert/Oglethorpe, and Spalding/Pike). Ground waters from private water supply wells developed in these aquifers were sampled and analyzed for their radioisotopic and chemical characteristics. Preliminary analysis of 90 ground-water and radioisotopic samples from the pilot study indicates that the geologic setting of the differing aquifers an provinces strongly influences the occurrence of natural radioisotopes in drinking water. Extremely high concentrations of uranium, radium, radon 222, lead 210, and polonium 210 in some aquifers indicate radioisotope enrichment within and near the well bore for some areas. Based on these findings, the present public water monitoring scheme, which is based on gross alpha particle activity, may require modification depending on differing isotopes, rock types, and geological provinces.

51750 (PB–90-256587/XAB) **Geographic information System technology applications to Ground-Water Management Program, EPA Region 3. Technical report.** Clibanoff, A. Drexel Univ., Philadelphia, PA (USA). Dept. of Civil Engineering. 1989. 21p. Source: NTIS, PC A03/MF A01.

The report is part of the National Network for Environmental Management Studies under the auspices of the Office of Cooperative Environmental Management of the U.S. Environmental Protection Agency. GIS technology is a computer informational system that stores, analyzes, and manipulates both spatial and non-spatial data. Base map information for the GIS has come primarily from the USGS. Data for the entire Region at the 1:2,000,000 scale and for some of the Region at the 1:100,000 scale is currently being used. Data from GIRAS, a land use Database, at the 1:250,000 also exists for much of the Region. Information is contributed to the GIS from various sources including but not limited to RCRA, CERCLA, UIC, and UST programs. The WHP program is also being tapped to identify locations of public water supply wells. Region III is interested in any data that accurately describes the ground water condition in a given area. In Regional pilot studies being conducted, GIS is being employed at both the regional and county level. The goals of the pilot studies include the identification of areas of ground water susceptibility and major sources of ground water contamination, and prioritizing the Region's ground water supplies in terms of vulnerability to pollution and risk to the population.

51751 (PB–90-256645/XAB) **Proposal for sampling methods data base: A Hypertext approach to hazardous-waste cleanup. Technical report.** Peterson, D. Brigham Young Univ., Provo, UT (USA). 1989. 15p. Source: NTIS, PC A03/MF A01.

The report is part of the National Network for Environmental Management Studies under the auspices of the Office of Cooperative Environmental Management of the U.S. Environmental

Protection Agency. The intent of developing a computerized database is that it will facilitate inquiries into hazardous waste cleanup – what equipment to use in the field, and which sampling and analytical methods would be proper given certain environmental conditions. The NNEMS project serves as a proposal on how further research should be conducted on the sampling issue and which computer software package would be best suited for that purpose. Currently, EPA databases lack sufficient information or the information is too scattered for an individual to find complete answers on questions relating to hazardous waste cleanup. The project defines suitable information to incorporate in a new database. It will include such information as: standards, sampling methods, quality assurance materials, and analytical methods. The proposed project will be written in KnowledgePro, a program which uses hypertext combined with database capabilities. It is easy to use and simple to program and reads EPA owned ASCII text files, Lotus and dBASE III files. This will enable EPA employees to access pertinent information related to hazardous waste cleanup.

51752 (PB–90-256744/XAB) **Report on land-based sources of marine pollution in the Caribbean. Technical report.** Betz, K.E. Michigan Univ., Ann Arbor, MI (USA). 1989. 175p. Source: NTIS, PC A08/MF A01.

The report is part of the National Network for Environmental Management Studies under the auspices of the Office of Cooperative Environmental Management of the U.S. Environmental Protection Agency. The document presents information gathered during a series of interviews with professionals from governmental agencies in each of the Caribbean nations, with the exception of the U.S. possessions. The report provides, on a nation-by-nation basis, background information regarding the sources of pollution and the agencies within each nation which retain some authority to remedy or otherwise manage these problems. Names of contact persons within these agencies, their phone numbers and addresses are also provided. The audience for the report is persons within organizations in the Caribbean Basin nations working to coordinate activities aimed at identifying and reducing land based sources of marine pollution. The report is a resource for achieving unified environmental efforts in the region. The final section briefly notes factors which may work in favor of regional solutions and those that may not.

51753 (PB–90-258963/XAB) **Laboratory and pilot-scale evaluations of physical/chemical treatment technologies for MGP site groundwaters. Topical report, January 1989-May 1990.** Weightman, R.L.; Smith, J.R. Remediation Technologies, Inc., Pittsburgh, PA (USA). May 1990. 230p. Contract GRI-5086-254-1334. Source: NTIS, PC A11/MF A02.

Treatability studies were performed to evaluate the treatment of Manufactured Gas Plant (MGP) site groundwaters using the following treatment processes: gravity separation, coagulation/flocculation, sand filtration, air stripping, carbon adsorption, and chemical oxidation. Treatment results for conventional parameters, inorganic compounds, metals, volatile aromatics, phenolics, and polynuclear aromatic hydrocarbons are presented and compared to regulatory limits associated with discharge to a Publicly Owned Treatment Works (POTW), discharge to a surface water body, or subsurface injection. Equipment costs as well as operating and maintenance costs are presented for several treatment strategies designed to achieve compliance with alternative discharge requirements.

51754 (PB–90-260076/XAB) **Health assessment for Potter's Septic Tank Service Pits, Maco, Brunswick County, North Carolina, Region 4. CERCLIS No. NCD981023260. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 18 Jul 1990. 19p. Source: NTIS, PC A03/MF A01.

The Potter's Septic Tank Service Pits site–located in Maco, North Carolina–has been placed on the National Priorities List by the U.S. Environmental Protection Agency. The site was used to dispose of waste oil, creosote, and septic sludge, either in shallow, unlined pits or by surface application. An EPA emergency removal occurred at the site in 1983. Soil-gas levels in Area 3 did not show contamination, and unless soil samples show otherwise, the site definition of Potter's Septic Tank Service Pits will include only the area known as Area 1. Volatile organic hydrocarbons, heavy metals, and polynuclear aromatic hydrocarbons found in shallow groundwater samples suggest that a large reservoir of contamination may remain at Area 1. The efficiency of the 1983 soil removal was not documented. Based upon information reviewed, the Agency for Toxic Substances and Disease Registry (ATSDR) has concluded that the site is of potential public health concern because of the risk to human health resulting from possible exposure to hazardous substances at concentrations that may result in adverse human health effects. Human exposure to volatile organic hydrocarbons, heavy metals, and polynuclear aromatic hydrocarbons may occur and may have occurred in the past via groundwater, surface water, soil, sediment, air, and the food chain. Recommendations are provided concerning a well monitoring program for residences in the area of the site.

51755 (PB–90-260092/XAB) **Health assessment for Richardson Flat Tailings, Park City, Summit County, Utah, Region 8. CERCLIS No. UTD980952840. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 24 Jul 1990. 21p. Source: NTIS, PC A03/MF A01.

The Richardson Flat Tailings, an Update 7 site proposed for the National Priorities List, is located 3.5 miles northeast of Park City, Summit County, Utah. From 1975 to 1981, the 160-acre site was used for disposing mine tailing wastes from the Keetly Ontario Mine and other mines owned by United Park City Mines. Currently no tailings are dumped at the site; however, soil from the site is being excavated and used to cover the tailings piles. Several metal contaminants, including arsenic, cadmium, chromium, lead, and zinc, have been detected in on-site and off-site areas. Contaminants may migrate from the site to off-site areas through surface water, groundwater, and airborne-associated pathways. Human exposure to site contaminants may occur through the ingestion of contaminated groundwater, food-chain entities, and soil; through dermal contact with contaminants; and through the inhalation of airborne dusts. The site is considered to be of potential public health concern because of the high levels of on-site contaminants.

51756 (PB–90-260100/XAB) **Health assessment for Redwing Carriers, Inc. (Saraland), Saraland, Alabama, Region 4. CERCLIS No. ALD980844385. Preliminary report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 18 Jul 1990. 21p. Source: NTIS, PC A03/MF A01.

The Redwing Carriers, Inc. (Saraland) site is in the community of Saraland, in Mobile County, Alabama. The site, about 1 acre, is in an urbanized area and had been used as a truck terminal between 1961 and 1971. Redwing Carriers cleaned out trucks that transported a variety of materials, including asphalt, diesel fuel, herbicides, tall oil, and sulfuric acid. Wastes were discharged onto the ground. The property was covered with fill material, and an apartment complex, housing about 180 tenants, was developed. On-site monitoring identified polynuclear aromatic hydrocarbons and a few other organic compounds in surface wastes and in subsurface wastes and soils. Using the information reviewed, the Agency for Toxic Substances and Disease Registry concludes that the site is of potential public health concern because humans may be exposed to hazardous substances at concentrations that may result in adverse health effects. Children are the most likely to be exposed to the contaminants associated with the recurring surficial waste deposits. Available monitoring data are not sufficient to clarify whether groundwater, ambient air, air in buildings, soils, sediments, surface water, and food-chain entities contain contaminants at levels that pose public health concerns or physical hazards.

51757 (PB–90-260126/XAB) **Health assessment for Maywood Chemical Company, Maywood, Bergen County, New Jersey, Region 2. CERCLIS No. NJD980529762. Final report.** Agency for Toxic Substances and Disease Registry, Atlanta, GA (USA). 30 Jul 1990. 24p. Source: NTIS, PC A03/MF A01.

The Health Assessment for the Maywood Chemical Company Site includes the Maywood Interim Storage Site (MISS), the Ballod property, the Scanel site, residential properties, and the Sears warehouse and its adjacent properties, all of which are located in the towns of Maywood and Rochelle Park of Bergen County, New Jersey. These sites are at different investigative or remediation

stages under the auspices of both the U.S. Environmental Protection Agency (EPA) and the U.S. Department of Energy (DOE). The EPA is responsible for chemical characterization and cleanup operations, whereas the DOE is primarily in charge of radiologic analysis and remediation. On the basis of the information reviewed, ATSDR and NJDOH have concluded that the Maywood Chemical site is of public health concern because humans have probably been exposed to hazardous substances at concentrations that may result in adverse health effects. As noted in the Environmental Contamination and Physical Hazards section above, human exposure to chemical and radiological contamination is probably occurring and has probably occurred in the past via the use of contaminated groundwater and contact with contaminated soils. Before suspected areas of contamination are developed, both on-site contamination and the potential off-site migration of contaminants need to be fully evaluated. Developing an area, without characterizing potential contamination could lead to an adverse impact on the public health.

51758 (PNL-SA–18038) **A synoptic summary approach to better understanding groundwater contamination problems and evaluating long-term environmental consequences.** Nelson, R.W. Pacific Northwest Lab., Richland, WA (USA). Sep 1990. 19p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830 ;AC04-76DP00789. (CONF-900484–3: 26. annual meeting of the National Council on Radiation Protection and Measurements, Washington, DC (USA), 4-5 Apr 1990). Order Number DE91000416. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A summary approach has been developed within groundwater hydrology to communicate with a broad audience and more completely evaluate the long-term impacts of subsurface contamination problems. This synoptic approach both highlights the dominant features occurring in subsurface contamination problems and emphasizes the information required to determine the long-term environmental impacts. The special merit of a summary approach is in providing a better understanding of subsurface contamination problems to adjoining technical disciplines, public decision makers, and private citizens. 14 refs.

51759 **American Chemical Society, Division of Environmental Chemistry, Vol. 30, No. 1.** 598p. American Chemical Society, Washington, DC (US) (1990). (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

Separate abstracts were prepared for 86 papers presented at this divisional meeting of the 199th ACS National Meeting.

51760 **Normal and surface-enhanced Raman scattering with optical fibers.** Myrick, M.L. (Environmental Sciences Div., Lawrence Livermore National Lab,. CA (US)); Angel, S.M. pp. 38-48 of Chemical, biochemical, and environmental fiber sensors: Volume 1172. Lieberman, R.A.; Wlodarczyk, M.T. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1989). pp. 318 (CONF-8909177–: O/E Fibers '89: meeting of the International Society for Optical Engineering, Boston, MA (USA), 5-8 Sep 1989).

Raman scattering techniques, because of the vibrational information they contain, have numerous applications in the measurement and identification of aqueous pollutants in groundwater as well as other contaminated waters. However, the extension of Raman techniques using fiber optics to remote sensing of ground water is not completely straightforward. Single-fiber optrodes provide the greatest signals but also large background levels. Multiple-fiber optrodes offer lower background levels but are not practical over very long distances and are not as sensitive as single-fiber optrodes. The difficulties of obtaining Raman spectra with fiber optics are discussed, and the potential techniques for overcoming the limitations of single-fiber devices are described. The results of Raman spectral measurement that were made using a dual-fiber optrode in a novel forward-scattering configuration are presented. The possible extension of these results to surface-enhanced Raman (SER) scattering is discussed. In addition initial results of SERS performed with optical fibers are presented, along with a description of future directions for this research.

51761 **Epilithic microbial populations and leaf decomposition in acid-stressed streams.** Palumbo, A.V. (Environmental Sciences Division, Oak Ridge National Lab., Oak Ridge, TN (US)); Mulholland, P.J.; Elwood, J.W. pp. 69-90 of Acid stress and aquatic microbial interactions. Rao, S.S. CRC Press Inc., Boca Raton, FL (USA) (1989). pp. 174

The number of bacteria on decomposing leaf material (direct counts of acridine orange-stained bacteria) and bacterial production on leaf material and on rock surfaces (incorporation of tritiated thymidine into deoxyribonucleic acid, DNA) were measured as part of a study of the effects of acidification on microbial communities in streams. The number of bacteria on leaf material ranged from 3.3 $\times 10^{10}$ to 12.4 $\times 10^{10}$ cells per gram dry weight, it was not significantly different among streams of different pH and aluminum concentration, it increased over the 1st 4 weeks of incubation, and it was relatively constant thereafter at all sites. There was no significant dilution of added thymidine by unlabeled internal or external pools of thymidine in measurements of bacterial production on leaf material. Bacterial production on both leaf and rock surfaces was significantly greater in streams with higher pH (> 5.5) than at matched sites in nearby streams with low pH (< 5.0). However, differences in productivity among sites were not evident until after 2 weeks of incubation of leaf material in the streams, and significant differences could not be generated in short-term (< 48-H) transplants of rock material from high to low pH sites. Therefore, the effects of acidification on bacteria do not appear to be due to acute toxicity.

51762 **Drilling and sampling procedures to minimize borehole cross-contamination.** Russell, B.F. (Idaho National Engineering Lab., Idaho Falls (USA)); Hubbell, J.M.; Minkin, S.C. pp. 81-93 of The proceedings of the third national outdoor action conference on aquifer restoration, ground water monitoring and geophysical methods. National Water Well Association, Dublin, OH (US) (1989). pp. 1161 DOE Contract AC07-76ID01570. (CONF-8905127–: 3. National Water Well Association outdoor action conference, Orlando, FL (USA), 22-25 May 1989).

Drilling and sampling procedures have been developed by scientists from the Idaho National Engineering Laboratory (INEL) to minimize the potential of cross-contamination within the borehole or from airborne contaminants. These procedures employ off-the-shelf wireline drilling equipment, including a Lexan inner core barrel. The procedures have been used in both air and mud rotary operations. Downhole quality assurance steps include the introduction of samarium oxide and/or perfluorocarbon tracers. The procedures were initially developed to support subsurface investigation at a low-level radioactive waste management complex in Idaho and have since been modified and used for Resource Conservation and Recovery Act/Comprehensive Environmental Response, Compensation, and Liability Act (RCRA/CERCLA) investigations in California and Idaho. Most recently, the procedures were employed in a research investigation in South Carolina to collect microorganisms from the deep subsurface. The procedures can be modified to reflect specific drilling objectives. Overall, the procedures have been effective in the minimization or elimination of cross-contamination. This approach to sampling represents the latest technology in hazardous waste subsurface investigations.

51763 **Delineation of brine drilling-fluid loss in an unsaturated zone - Application to contamination monitoring.** Bartel, L.C. (Sandia National Labs., Albuquerque, NM (USA)). pp. 841-854 of The proceedings of the third national outdoor action conference on aquifer restoration, ground water monitoring and geophysical methods. National Water Well Association, Dublin, OH (US) (1989). pp. 1161 DOE Contract AC04-76DP00789. (CONF-8905127–: 3. National Water Well Association outdoor action conference, Orlando, FL (USA), 22-25 May 1989).

The controlled-source audio frequency magnetotelluric (CSAMT) surface electromagnetic geophysical technique shows promise for delineation of zones of drilling-fluid loss and for delineating and monitoring zones of ground-water contamination in general. At the Waste Isolation Pilot Plant (WIPP) site near Carlsbad, NM, hydrology test wells are drilled with a brine drilling fluid where significant drilling-fluid losses often occur during drilling. Pre- and post-drilling CSAMT surveys were performed at the site of a newly drilled well.

During the drilling of this new hydrology test well, the majority of some 400 obls of brine drilling fluid were lost in an unsaturated zone at a depth of approximately 60 m. The pre- and post-drilling CSAMT survey measured apparent resistivities show marked decreases of over 30% for data stations near the newly drilled well, while at some distant data stations the changes were minimal. From an analysis of the data, the zone of lost drilling fluid was delineated. The results of these surveys show the application of the CSAMT surface geophysical technique, as well as electromagnetic surface geophysical techniques in general, to delineating and monitoring zones of ground-water contamination.

51764 Chemical sensing of chlorinated hydrocarbons by photo-SERS. Carrabba, M.M. (EIC Labs., Inc., Norwood, MA (USA)); Edmonds, R.; Rauh, R.D. pp. 983-984 of Electrochemical Society 1989 Fall meeting (Abstracts): Volume 89-2. The Electrochemical Society, Pennington, NJ (USA) (1990). pp. 1010 (CONF-8910107–: Electrochemical Society fall meeting, Hollywood, FL (USA), 15-20 Oct 1989).

Techniques to sense and monitor chlorinated hydrocarbon solvents (CHS) are becoming increasingly more important with their intensifying presence as groundwater pollutants. Previous work has shown the usefulness of surface enhanced Raman spectroscopy (SERS) for the detection of groundwater contaminants, and the techniques has recently been adapted to remote fiber optic sampling. However, these past experiments have mainly been restricted to aromatic hydrocarbons. The authors report on SERS of the following chlorinated hydrocarbons or organochlorides: carbon tetrachloride, 1,2-dichloroethane (DCE), chloroform and trichlorethylene (TCE).

51765 Optical spectroscopic screening of environmental water samples. Haas, J.W. III (Oak Ridge National Laboratory, TN (USA)); Gammage, R.B. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 30(1): 109 (1990). DOE Contract AC05-84OR21400. (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

The monumental task of monitoring watersheds for anthropogenic organic chemical contamination can be facilitated by screening techniques which are rapid and inexpensive. One approach to screening is to use less sophisticated instruments and methods adapted for field use. The result is a much faster, if sometimes less detailed, assessment of a watershed than is obtained by conventional laboratory analysis. A second approach is to use instruments which make measurements in situ, thereby eliminating the time and expense of sample collection and handling. Using UV-visible and fluorescence spectroscopies, examples of both approaches will be presented for contaminated groundwater.

51766 Ultrasensitive fluorescence analysis in levitated microdroplets. Ramsey, J.M. (Oak Ridge National Laboratory, TN (USA)); Whitten, W.B. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 30(1): 146 (1990). DOE Contract AC05-84OR21400. (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

The extreme sensitivity of fluorescence spectrophotometry results from the fact that a molecule can undergo many excitation-emission cycles before destruction by photochemical degradation. Sufficient signal exists for single molecules to be detectable. Detection limits for molecules in solution have been limited to $\approx 10^{-13}$ M by background signal from solvent Raman scattering and fluorescence. Fewer numbers of molecules are detectable by reduction of analysis volume. In our experiments the measurement volume, and hence the background signal, is reduced by observing a single microdroplet of solution levitated in an electrodynamic trap. An argon-ion laser is used to excite fluorescence from R6G molecules contained in glycerol droplets. We estimate our current detection limit at ≈100 R6G R6G molecules in 20-μm diameter glycerol droplets.

51767 PAH [polynuclear aromatic hydrocarbons] binding to natural organic matter (NOM): A comparison of NOM fractions and analytical methods. Amy, G.L. (Univ. of Arizona, Tucson (USA)); Liu, Houmao. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 30(1): 243-246 (1990). (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

It is well known that polynuclear aromatic hydrocarbons (PAHs) bind to humic substances. In this study, the binding of phenanthrene to natural organic matter (NOM) has been investigated by three methods: fluorescence quenching, reverse-phase separation using Sep-Pak (C-18), and dialysis. Two different sources of bulk NOM as well as various NOM fractions (e.g., molecular weight; humic versus non-humic) have been studied.

51768 Use of ^{14}C-labeled seston to study fine particulate organic matter dynamics in flowing water. Cushing, C.E. (Battelle-Pacific Northwest Laboratory, Richland, WA (USA)); Minshall, G.W.; Newbold, J.D. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 30(1): 305-307 (1990). (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

Transport, deposition, and resuspension of fine particulate organic matter (FPOM, <1 mm) is an important aspect of the energy dynamics in streams. However, it has been virtually impossible to study these factors because of the difficulty in working with particles of such small sizes. Two papers (Banks and Wolfinbarger 1981 and Wolfinbarger and Crosby 1983) describing methods for labeling marine detritus with ^{14}C led us to explore these methods for studying FPOM dynamics in flowing water.

51769 Site specific interactions of two hydrophobic ionizable compounds on clay-coated-alumina. Szecsody, J.E. (Pacific Northwest Laboratory, Richland, WA (USA)); McBride, J.F. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 30(1): 347-349 (1990). (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

In groundwater systems containing soils with low organic content, sorption of hydrophobic ionizable compounds (HOC) can be attributed to interactions with 2:1 clay surfaces. The purpose of this research is to examine different sorption mechanisms on 2:1 clay surfaces in column systems and evaluate how sorption parameters might differ from batch sorption with clay sorbents. Two solutes, quinoline and 1-aminonaphthalene, are used in this research, where quinoline sorbs to montmorillonite by an ion exchange mechanism, whereas 1-aminonaphthalene is reported to undergo reversible sorption by ion exchange and an irreversible transformation on montmorillonite.

51770 Influence of mineral bound humic acids on the sorption of hydrophobic organic compounds. Murphy, E.M. (Battelle Pacific Northwest Laboratory, Richland, WA (USA)); Zachara, J.M.; Smith, S.C. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 30(1): 350-352 (1990). (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

Dissolved humic substances are present in many ground waters (Thurman, 1985) and have been shown to bind or associate with hydrophobic organic compounds (HOC) facilitating HOC transport. Dissolved humic substances may also absorb to mineral surfaces, rendering hydrophilic surfaces hydrophobic and making them sorbents for HOC. The objectives of this work were to (1) investigate the dependence of HOC sorptivity on the fractional surface coverage of mineral surfaces with humic substances, (2) to establish whether HOC sorptivity was influenced by the aromaticity/aliphilicity of the humic coating, and (3) to identify whether different mineral surfaces imparted a different structure to the adsorbed organic substances that affected HOC sorption.

51771 The effects of groundwater chemistry on cometabolism of chlorinated solvents by methanotrophic bacteria. Palumbo, A.V. (Oak Ridge National Laboratory, TN (USA)); Strandberg, G.W.; Eng, W. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA),* 30(1): 460-463 (1990). (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

Degradation of chlorinated alkenes such as trichloroethylene (TCE) by methanotrophic bacteria is a promising technology for the

remediation of contaminated groundwater. Ultimately, the cost and the success of this approach may be dependent on the influence of groundwater chemistry on degradation rates and extent. TCE can rapidly be reduced to low levels in laboratory cultures growing on defined media. The goal of our research is to quantify the potential effects of groundwater chemistry on the biodegradation of TCE by methanotrophs and to define concentrations of methane that need to be added to the system. This includes work on major nutritional requirements (e.g. PO_4) but has focused on competitive inhibition and cofactors.

51772 Binding and bioavailability of organic micropollutants in natural waters: Effects of the quality and quantity of dissolved organic material. Kukkonen, J. (Univ. of Joensuu (Finland)); Oikari, Aimo; McCarthy, J.F. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA)*, 30(1): 513-516 (1990). DOE Contract AC05-84OR21400. (CONF-900402–: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

Humic substances or, more generally, dissolved organic material (DOM), in the natural waters are important in water chemistry and aquatic toxicology because number of studies have demonstrated that they can bind hydrophobic organic pollutants such as polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs) and polychlorinated dioxins and dibenzofurans (1-3). However the affinity of the organic matter for binding a given pollutant varies among waters from different sources. The purpose of this study was to demonstrate that isolated subcomponents of DOM (XAD-8 fractionations) differ in their affinity for binding contaminants, and to determine whether the relative binding affinities and relative abundance of the subcomponents could account for the correlations observed in the different sources of DOM.

51773 (CONF-9006194–2) **The structure and function of membrane protein photosynthetic reaction center.** Chang, Chong-Hwan; Tiede, D.; Norris, J.; Schiffer, M. Argonne National Lab., IL (USA). [1990]. 5p. Sponsored by U.S. DOE Energy Research; U.S. Department of Health and Human Services. DOE Contract W-31109-ENG-38. Grant GM36598. From 11. international science and technology symposium; Seoul (Republic of Korea); 25-29 Jun 1990. Order Number DE90017795. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The three dimensional structure of the photosynthetic reaction center from Rhodobacter (Rb.) sphaeroides has been determined using x-ray diffraction technique. It has 11 membrane spanning helixes, five each from the L and M subunit and one from the H subunit. There is a pseudo-twofold symmetry between the L and M subunits and their amino acid sequences have some similarity. The pigment components, which are located at the hydrophobic core of the reaction center also have this symmetry. We confirmed that two bacteriochlorophylls have a predicted conformation called a "special pair." The nonheme iron is liganded with four histidines and one glutamic acid. 13 refs., 2 figs.

51774 (CONF-9008116–1) **Drug delivery by organ-specific immunoliposomes.** Maruyama, Kazuo (Tennessee Univ., Knoxville, TN (USA). Dept. of Biochemistry); Mori, Atsuhide; Hunag, Leaf; Kennel, S.J. Oak Ridge National Lab., TN (USA). [1990]. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From International symposium on radiation effects on polymeric materials - satellite symposium to the 200th national meeting of the American Chemical Society; Washington, DC (USA); 26-31 Aug 1990. Order Number DE91000559. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Monoclonal antibodies highly specific to the mouse pulmonary endothelial cells were conjugated to liposomes. The resulting immunoliposomes showed high levels of lung accumulation when injected intravenously into mice. Optimal target binding and retention were achieved if the lipid composition included ganglioside GM_1 to reduce the uptake of immunoliposomes by the reticuloendothelial system. Details of the construction and optimization of these organ-specific immunoliposomes are reviewed. The drug delivery potential of this novel liposome system was demonstrated in an experimental pulmonary metastasis model. Immunoliposomes containing a lipophilic prodrug of deoxyfluorouridine effectively prolonged the survival time of the tumor-bearing mice. This and other therapeutic applications of the immunoliposomes are discussed. 25 refs., 5 figs.

51775 (DOE/ER/13257–T1) **[Catalytic mechanism of hydrogenase from aerobic N_2-fixing microorganisms]: Progress report.** Arp, D.J. California Univ., Riverside, CA (USA). [1990]. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-84ER13257. Order Number DE91000126. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Hydrogenases are enzymes which catalyze reactions involving dihydrogen. They serve integral roles in a number of microbial metabolic pathways. Our research is focussed on investigations of the catalytic mechanism of the hydrogenases found in aerobic, N_2-fixing microorganisms such as Azotobacter vinelandii and the agronomically important Bradyrhizobium japonicum as well as microorganisms with similar hydrogenases. The hydrogenases isolated from these microorganisms are Ni- and Fe-containing heterodimers. Our work has focussed on three areas during the last grant period. In all cases, a central theme has been the role of inhibitors in the characteristics under investigation. In addition, a number of collaborative efforts have yielded interesting results. In metalloenzymes such as hydrogenase, inhibitors often influence the activity of the enzyme through ligand interactions with redox centers, often metals, within the enzyme. Therefore, investigations of the ability of various compounds to inhibit an enzyme's activity, as well as the mechanism of inhibition, can provide insight into the catalytic mechanism of the enzyme as well as the role of various redox centers in catalysis. We have investigated in detail four inhibitors of A. vinelandii and the results are summarized here. The influence of these inhibitors on the spectral properties of the enzyme are summarized. Electron paramagnetic resonance and ultraviolet spectra investigations are discussed. 9 figs.

51776 (LBL–27660, pp. 166-172) **Exciton microscopy and scanning optical nanoscopy.** Kopelman, R. (Univ. of Michigan, Ann Arbor (USA)); Lewis, A.; Lieberman, K. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences*. 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

We describe the development of a new biologically non-invasive ultraresolution light microscopy, based on combining the energy transfer spectral ruler method with the micro-movement technology employed in STM. We use near-filed scanning optical microscopy, with micropipettes containing crystals of energy packaging donor molecules in the tips that can have apertures below 5 nm. The excitation of these tips extends near field microscopy well beyond the 50 nm limit. The theoretical resolution limit for this spectrally-sensitive light microscopy is well below 1 nm.

51777 Development of a database for nucleotide sequences. Fickett, J.W. (Theoretical Biology and Biophysics, Los Alamos National Lab., Los Alamos, NM (US)); Burks, C. pp. 1-34 of Mathematical methods for DNA sequences. Waterman, M.S. CRC Press Inc., Boca Raton, FL (USA) (1989). pp. 282

Computer analysis can greatly aid understanding of DNA sequence data. The sequences are often meaningless to the human eye; there is abundant evidence that humans cannot even copy over a DNA sequence without making frequent errors. Patterns that seem significant when one person looks at five or ten genes often

turn out to be the result of random variation when a larger scale analysis is carried out. To make these data available for significant analysis, one must first gather and organize them into a comprehensive database. Although several specialized computer collections of nucleic acid sequence data are mentioned briefly, the authors focus in this chapter is on general applications of the data and on comprehensive collections. They describe one approach, undertaken by the GenBank staff at LANL (Los Alamos National Laboratory), to the development of a database that does justice to the natural structure of the data, facilitates current applications, and allows expansion for the foreseeable future.

51778 A fiberoptic antibody-based biosensor with time-resolved detection. Vo-Dinh, T. (Advanced Monitoring Development Group, Health and Safety Research Div., Oak Ridge National Lab., Oak Ridge, TN (US)); Nolan, T.; Cheng, Y.F.; Alarie, J.P.; Speaniak, M.J. pp. 266-272 of Chemical, biochemical, and environmental fiber sensors: Volume 1172. Lieberman, R.A.; Wlodarczyk, M.T. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1989). pp. 318 DOE Contract AC05-84OR21400. (CONF-8909177–: O/E Fibers '89: meeting of the International Society for Optical Engineering, Boston, MA (USA), 5-8 Sep 1989).

A phase-resolved fiberoptic antibody-based biosensor is described, which combines the biochemical specificity of antigen-antibody reaction the high sensitivity of laser excitation, the versatility of fiberoptic sensors, and the selectivity of phase-resolved detection. The device can differentiate benzo(a)pyrene and benzo(a) pyrene tetrol, a DNA-adduct product of the carcinogen benzo(a)pyrene. The limit of detection of benzo(a) pyrene tetrol is in the attomole range (10^{-18} moles).

51779 ras Oncogene proteins: Three-dimensional structures, functional implications, and a model for signal transducer. Kim, S.H. (Univ. of California, Berkeley (USA)); de Vos, A.M.; Tong, L.; Milburn, M.V.; Matias, P.M.; Jancarik, J.; Ohtsuka, E.; Nishimura, S. pp. 273-281 of Cold spring harbor symposia on quantitative biology. Volume 53, Molecular biology of signal transduction. The Cold Spring Harbor Laboratory, Cold Spring Harbor, NY (US) (1988). pp. 550 (CONF-8805382–Pt.1: 53. symposium on the molecular biology of signal transduction, Cold Spring Harbor, NY (USA), 25 May - 1 jun 1988).

The authors have recently determined the crystal structures of the catalytic domain of a normal and two transforming c-Ha-ras p21 proteins lacking the flexible 18 residues at the carboxyl termini. They present here features of these crystal structures relevant to the known biochemical properties and functions, describe the differences between normal and transforming p21 proteins in the GDP-bound form, propose a model of the α subunit of G proteins derived on the basis of crystal structure of p21, and suggest a possible mechanism for conformational change on GDP/GTP exchange.

51780 Sequence of the Erysiphe graminis f. sp. hordei gene encoding β-tubulin. Sherwood, J.E. (Michigan State Univ., East Lansing (USA)); Somerville, S.C. *Nucleic Acids Research (UK)*, 18(4): 1052 (25 Feb 1990).

The β-tubulin gene from Eyrsiphe graminis f. sp. hordei race CR3 was isolated from a genomic λ2001 library prepared from conidial DNA, using the Neurospora crassa tub-2 gene as a probe. The deduced E. g. hordei structural gene, which encoded a polypeptide of 446 amino acids, was interrupted by six introns with positional and splice sequence homology to the N. crassa tub-2 gene. The amino acid sequence showed a high degree of homology to other fungal β-tubulins. A major difference between the E. g. hordei gene and the majority of other fungal β-tubulin genes was the lack of codon usage bias observed with the E. g. hordei gene, in which 60 of the 61 sense codons were present. This sequence was the only β-tubulin gene detected in Southern blotting experiments.

51781 Fluorescence line-narrowing spectral analysis of in vivo human hemoglobin-benzo[a]pyrene adducts: Comparison to synthetic analogues. Jankowiak, R. (Iowa State Univ., Ames (USA)); Small, G.J.; Day, B.W.; Skipper, P.L.; Tannenbaum, S.R.; Lu, Peiqi; Doxtader, M.M. *Journal of the American Chemical Society (USA)*, 112(15): 5866-5869 (18 Jul 1990). DOE Contract W-7405-ENG-82.

In order to gain insight as to the structure(s) of the adduct formed in vivo between human hemoglobin and the anti-diol epoxide (anti-BPDE) of benzo[a]pyrene (BaP), a series of model compounds was synthesized to investigate the effect on the fluorescence line-narrowing (FLN) spectra of heteroatom substitution at C-10 in BaP tetrahydrotetrol analogues. Spectra taken at 4.2 K by vibronic laser excitation at both 356.9 and 363.4 nm revealed marked differences between BaP tetrahydrotetrols and synthetic thioether, amino, and ester adducts of anti-BPDE. Use of these same excitation wavelengths on intact human globin samples obtained from individual s environmentally exposed to ambient levels of BaP yielded vibronic FLN spectra that were virtually indistinguishable from those of a synthetic C-10 carboxylic ester derived from anti-BPDE.

51782 Characterization of the structure and melting of DNAs containing backbone nicks and gaps. Snowden-Ifft, E.A. (Lawrence Berkeley Laboratory, CA (USA)); Wemmer, D.E. *Biochemistry (USA)*, 29(25): 6017-6025 (26 Jun 1990).

A DNA molecule containing a gap (a missing phosphate) has been examined and compared to two other molecules of the same sequence, one containing a nick (a phosphorylated gap) and the other a normal duplex containing no break in the backbone. A second gapped sequence was also compared to a normal duplex of the same sequence. The molecules containing nicks or gaps were generated as dumbbell molecules, short helices closed by a loop at each end. The dumbbells were formed by the association of two hairpins with self-complementary dangling 5'-ends. Nuclear magnetic resonance was used to monitor the melting transition and to probe structural differences between molecules. Under the conditions used here no change in stability was observed upon phosphorylation of the gap. Structural changes upon phosphorylation of a gap or closure of a nick were minimal and were localized to the region immediately around the gap or nick. Two transitions can be observed as a gapped or nicked molecule melts, although the resolution of the two transitions varies with the salt concentration. At moderate to high salt (greater than or equal to 30 mM) the molecule melts essentially all at once. At low salt the two transitions occur at temperatures that differ by as much as 15 degrees C. In addition, comparison with other NMR melting studies indicates that the duplex formed by the overlap of the dangling ends of the hairpins is stabilized relative to a free duplex of the same sequence, probably by stacking onto the hairpin stem.

51783 Nucleotide sequence of the triosephosphate isomerase gene from Macaca mulatta. Old, S.E. (Univ. of Michigan, Ann Arbor (USA)); Mohrenweiser, H.W. *Nucleic Acids Research (UK)*, 16(18): 9055 (26 Sep 1988).

The triosephosphate isomerase gene from a rhesus monkey, Macaca mulatta, charon 34 library was sequenced. The human and chimpanzee enzymes differ from the rhesus enzyme at ASN 20 and GLU 198. The nucleotide sequence identity between rhesus and human is 97% in the coding region and >94% in the flanking regions. Comparison of the rhesus and chimp genes, including the intron and flanking sequences, does not suggest a mechanism for generating the two TPI peptides of proliferating cells from hominoids and a single peptide from the rhesus gene.

51784 Casein gene expression in mouse mammary epithelial cell lines: Dependence upon extracellular matrix and cell type. Medina, D. (Baylor College of Medicine, Houston, TX (USA)); Oborn, C.J.; Li, M.L.; Bissell, M.J. *Experimental Cell Research (USA)*, 172(1): 192-203 (Sep 1987). DOE Contract AC03-76SF00098.

The COMMA-D mammary cell line exhibits mammary-specific functional differentiation under appropriate conditions in cell culture. The cytologically heterogeneous COMMA-D parental line and the clonal lines DB-1, TA-5, and FA-1 derived from the COMMA-D parent were examined for similar properties of functional differentiation. In monolayer cell culture, the cell lines DB-1, TA-5, FA-1, and MA-4 were examined for expression of mammary-specific and

epithelial-specific proteins by an indirect immunofluorescence assay. The clonal cell lines were relatively homogeneous in their respective staining properties and seemed to represent three subpopulations found in the heterogeneous parental COMMA-D lines. None of the four clonal lines appeared to represent myoepithelial cells. The cell lines were examined for expression of β-casein mRNA in the presence or absence of prolactin. The inducibility of β-casein in the COMMA-D cell line was further enhanced by a reconstituted basement membrane preparation enriched in laminin, collagen IV, and proteoglycans. These results support the hypothesis that the functional response of inducible mammary cell populations is a result of interaction among hormones, multiple extracellular matrix components, and specific cell types.

51785 **Modification of MCDB 110 medium to support prolonged growth and consistent high cloning efficiency of diploid human fibroblasts.** Ryan, P.A. (Michigan State Univ., East Lansing (USA)); Maher, V.M.; McCormick, J.J. *Experimental Cell Research (USA)*, 172(2): 318-328 (Oct 1987).

In preparation for studies on the growth factor requirements of normal and transformed human fibroblasts, we have developed a serum-free medium that supports vigorous long-term serial subculture of diploid human fibroblasts and allows them to form large-sized colonies with high efficiency (40 to 60%) when plated at cloning density. This medium, which is a modification of Ham's MCDB 110 base medium with its serum replacement supplements, is relatively easy to prepare and the cost of the serum replacements is approximately the same as that of fetal bovine serum supplied at 10%. The ingredients of Supplement B of MCDB 110 medium were added in an ethanol solution, rather than in the form of liposomes, and were combined with bovine serum albumin, a lipid carrier. Gelatin and fetuin were included as attachment factors instead of polylysine. Bioassays indicated that none of the ingredients in the medium were contaminated with either epidermal growth factor or platelet-derived growth factor. In this modified serum-free medium, which the authors have designated McM + SR_1, diploid human fibroblasts grew for 21 days at the same rate as in the base medium, McM, supplemented wt 10% FBS. During the next 20 days, they underwent 15 population doublings which was 75% of the rate of cells growing in the medium containing serum.

51786 (DOE/ER/60636-3) **Genes and gene expression: Localization, damage and control: A multilevel and interdisciplinary study: Progress report, February 1, 1990-January 31, 1991.** Ts'o, P.O.P. Johns Hopkins Univ., Baltimore, MD (USA). Sep 1990. 33p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER60636. Order Number DE91000880. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The main objectives of this Program Project is to develop strategy and technology for the study of gene structure, organization and function in a multi-disciplinary, highly coordinated manner. In Project I, Molecular Cytology, the establishment of all instrumentation for the computerized microscopic imaging system (CMIS) has been completed with the software in place, including measurement of the third dimension (along the Z-axis). The technique is now at hand to measure single copy DNA in the nucleus, single copy mRNA in the cell, and finally, we are in the process of developing mathematical approaches for the analysis of the relative spatial 3-D relationship among the chromosomes and the individual genes in the interphasal nucleus. Also, we have a sensitive and reliable method for measuring single-stranded DNA breaks which will be useful for the determination of damage to DNA caused by ionizing radiation. In Project II, the mapping of restriction fragments by 2-D enzymatic and electrophoretic analysis has been perfected for application. In Project III, a major finding is that the binding constant and effectiveness of antisense oligonucleotide analogues, Matagen, can be significantly improved by substituting 2'-O-methylribos methylphosphonate backbones for the current 2'-deoxyribomethylphosphonate backbones. 15 refs., 10 figs., 2 tabs.

51787 **A possible role of retrotransposons in carcinogenesis.** Weinstein, I.B. (Columbia Univ. Comprehensive Cancer Center and Institute of Cancer Research, New York, NY (US)); Hsieh, L.; Begemann, M.; Dragani, T.A.; Peraino, C. pp. 289-298 of Eukaryotic transposable elements as mutagenic agents. Lambert, M.E.; McDonald, J.F.; Weinstein, I.B. Cold Spring Harbor Laboratory, Cold Spring Harbor, NY (USA) (1988). pp. 342

Carcinogenesis involves complex changes in gene expression and the strucure of cellular DNA. The DNA of mammalian cells, including humans, contains thousands of copies of endogenous retrovirus-like elements whose structures closely resemble transposable elements found in lower organisms.

51788 **Bioaccumulation of benzo(a)pyrene from sediment by fathead minnows: Effects of organic content, resuspension, and metabolism.** McCarthy, J.F. (Oak Ridge National Laboratory, TN (USA)); Burrus, L.W.; Tolbert, V.R. *American Chemical Society, Division of Environmental Chemistry, Preprints (USA)*, 30(1): 495-498 (1990). DOE Contract AC05-84OR21400. (CONF-900402--: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

It is the objective of this research to examine the interaction of chemical and biological variables that influence the uptake and accumulation of a model contaminant, BaP, by the fathead minnow, Pimephales promelas. Specifically, we examine effects of the organic carbon content (OC) of the sediment on partitioning of BaP into the water and on the rate of ingestion of contaminated sediment, the effect of bioturbation of sediment by fish on the aqueous concentration of BaP in the water column, and the apparent increase in the rate of elimination of BaP in fish receiving higher levels of exposure to BaP from sediment and water.

51789 (AD-A-223779/0/XAB) **Filmless radiology: The design, integration, implementation, and evaluation of a digital imaging network. Final report, 1 March 1986-31 January 1990.** Cerva, J.R.; Kerlin, B.D.; Pocinki, L.S. Mitre Corp., McLean, VA (USA). Jun 1990. 90p. Contract DAMD17-86-C-6145. (MTR-90W00040). Source: NTIS, PC A05/MF A01.

Medical images generated by radiological procedures typically result in the generation of film-based images. In 1986, the U.S. Army Medical Research and Development Command contracted with the MITRE Corporation to investigate the use of filmless radiology in both its fixed facility and battlefield medical systems. To support this evaluation, commercially available Digital Imaging Network System (DINS) equipment was competitively procured and installed at two university medical centers, which competed for the opportunity to participate in this evaluation. Equipment provided by AT&T was installed at Georgetown University and equipment provided by Philips Medical Systems was installed at the University of Washington. In parallel, a prototype battlefield DINS was developed by MITRE, using commercially available workstation technology, to support concept exploration of DINS in the battlefield environment. This document summarizes and presents the results of the systems engineering studies and technical evaluations that were conducted as part of this four-year study.

51790 (BIR-18) **Technical and physical parameters for quality assurance in medical diagnostic radiology: Tolerances, limiting values and appropriate measuring methods.** Moores, B.M. (Radiation Protection Service, Liverpool (UK)); Stieve, F.E.; Eriskat, H. British Inst. of Radiology, London (UK); Commission of the European Communities, Brussels (Belgium). Directorate General for Science, Research and Development; Commission of the European Communities, Brussels (Belgium). Directorate General for Employment, Social Affairs and Education. 1989. 165p. (CONF-8802161--: Workshop on technical and physical parameters for

quality assurance in medical diagnostic radiology: tolerances, limiting values and appropriate measuring methods, Brussels (Belgium), 23-25 Feb 1988; EUR–11620). Source: Available from The British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The proceedings of a workshop on Technical and Physical Parameters for Quality Assurance in Medical Diagnostic Radiology are presented. The fifty-one papers presented at the workshop dealt with subject areas covering organizational aspects of quality control, parameters of the image-producing system using conventional x-ray equipment or special equipment and techniques, system analysis and image performance of image-recording systems, retrieval and viewing conditions and dosimetry. Fifty papers are selected and indexed separately. (Author).

51791 (BNL–44480) **Biomedical elemental analysis and imaging using synchrotron x-ray microscopy.** Jones, K.W. (Brookhaven National Lab., Upton, NY (USA)); Gordon, B.M.; Schidlovsky, G.; Spanne, P.; Dejun, Xue; Bockman, R.S.; Saubermann, A.J. Brookhaven National Lab., Upton, NY (USA). [1990]. 11p. Sponsored by U.S. DOE Energy Research; U.S. Department of Health and Human Services. DOE Contract AC02-76CH00016. Grant P41RR01838. (CONF-900877–8: 12. international congress for electron microscopy, Seattle, WA (USA), 12-18 Aug 1990). Order Number DE91000901. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The application of synchrotron x-ray microscopy to biomedical research is currently in progress at the Brookhaven National Synchrotron Light Source (NSLS). The current status of the x-ray microscope (XRM) is reviewed from a technical standpoint. Some of the items considered are photon flux, spatial resolution, quantitation, minimum detection limits, and beam-induced specimen damage. Images can be produced by measurement of fluorescent x rays or of the attenuation of the incident beam by the specimen. Maps of the elemental distributions or linear attenuation of the incident beam by the specimen. Maps of the elemental distributions or linear attenuation coefficients can be made by scanning the specimen past the beam. Computed microtomography (CMT) can be used for non- destructive images through the specimen in either the emission or absorption mode. Examples of measurements made with the XRM are given.

51792 (INIS-mf–12120) **The value of soft x-rays in the treatment of plastic induration of the penis.** Kodalle, W. Muenchen Univ. (Germany, F.R.). Medizinische Fakultaet. 26 Jul 1984. 83p. (In German). Order Number DE90706221. Source: NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

When the therapeutic results achieved in 92 patients treated during the period between 1969 and 1981 were analysed, it was found that there were no clearly defined, uniform criteria to evaluate the success of treatment, due to which fact there was basis for comparisons with other studies. Radiotherapy using soft x-rays solely has an indication in patients where the pressure of illness, in particular that at the emotional level, is considerable. In view of the fact that the available methods of treatment appear to be equally effective, any such therapy ought to be adjusted to the requirements of each individual patient and the severity of the disease and carried out in such a way that the risk of complications is kept to a minimum. Treatment with soft x-rays is particularly suitable in the initial stages of the disease, when the patients mainly complain of pain and painful cohabitation and appears to be more promising in youngish men. Clinicians should be cautious not to exceed a total dose of 2400 rad.

51793 (INIS-mf–12121) **Serial computed tomography and its uses in the diagnosis of pathological changes in the liver, pancreas and kidneys.** Schmiedel, R. Freie Univ. Berlin (Germany, F.R.). 8 Jul 1983. 124p. (In German). Order Number DE90706222. Source: NTIS (US Sales Only), PC A06/MF A01; OSTI; INIS.

The investigations described were carried out in such a way as to fulfil the defined requirements of serial computed tomography like short periods of measurement, high scanning frequency and intravasal bolus injection of a contrast medium that would readily be excreted by the renal route. In this connection, the following questions were of particular interest: 1. Is computed serial tomography able to provide better clues to tissue identification and the distinction between normal and pathological structures in the liver, pancreas and kidneys? 2. Would it be possible to obtain information as to the degree of vascularisation in space-occupying pathological processes in the liver, pancreas and kidneys? 3. Is serial computed tomography a useful tool to diagnose specific pathological changes in the liver, pancreas and kidneys? 4. Would this investigation permit predictions to be made about the functional performance of the liver, pancreas and kidneys?

51794 (INIS-mf–12122) **Post-mortem radiography of the lungs: Experiments to compare various methods of examination and descriptions of their usefulness in actual practice.** Pankow, W. Marburg Univ. (Germany, F.R.). Fachbereich 20 - Humanmedizin. 11 Jul 1986. 98p. (In German). Order Number DE90706223. Source: NTIS (US Sales Only), PC A05/MF A01; OSTI; INIS.

Described is the post-mortem examination of the isolated lung using radiologic-morphologic and histologic methods. Comparisons are made ragarding practical value of the conservation techniques chosen, which were the method of Markaria and Heitzmann that is based on fixing in alcohol and air drying and the nitrogen freezing method developed by Rau and colleagues. Both methods ensure adequate visualition of the pulmonary ultrastructure by x-rays, even though this observation should be qualified by the fact that pulmonary tissue fixed in alcohol tends to shrink and that intraalveolar edema are thus artificially reduced. Either of the methods under investigation permits angiographic and bronchographic examinations to be carried out without difficulty. In macroscopic evaluations better results are obtained for lungs fixed in alcohol. Freeze-dried samples offer advantages in the histological assessment of the pulmonary ultrastructure. Post-mortem radiography of the lungs is particularly valuable in the analysis of pathological changes in the pulmonary structure.

51795 (INIS-mf–12123) **Experimental study on the hydroxyproline content of enteroanastomoses established in irradiated intestines of rats.** Winter, S. Freie Univ. Berlin (Germany, F.R.). 14 Aug 1984. 163p. (In German). Order Number DE90706224. Source: NTIS (US Sales Only), PC A08/MF A01; OSTI; INIS.

Cross-bred Sprague-Dawley rats were subjected to percutaneous x- irradiation of the rectosigmoid using a split-dose regimen and focal dose of 50 Gy. One day as well as one, two and four months after the cessation of irradiation a termino-terminal anastomosis was established in the era exposed to radiation. On days 3, 7, 14, and 21 after surgery those parts of the intestine, which had been united by anastomosis, were removed in order to determine the hydroxyproline content of the latter. Further determinations were made in specimens of the tissue 1 cm above the anastomosis and carried out before surgery, after intraperitoneal injection of the anaesthetic alone or in animals subjected to laparatomy including intestinal exposure, where no anastomosis was established. In general, the collagen levels determined in colon anastomoses of irradiated or non-irradiated intestines of rats did not point to any adverse effects from radiation on the healing process. This result appears to be largely consistent with the experiences so far gained at the clinical level in the preoperative irradiation of colon carcinomas.

51796 (INIS-mf–12125) **Quantitative evaluations in planar myocardial scintigraphy using 201-thallium.** Kaiser, J.W. Tuebingen Univ. (Germany, F.R.). Medizinische Fakultaet. 1987. 73p. (In German). Order Number DE90706225. Source: NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

The observation that the judgements of myocardial images obtained by 201-thallium scintigraphy tend to vary considerably between investigators has prompted us to develop two versions of a quantitative evaluation technique which – after orthogonal-polar adjustment of the coordinates (with the centre of the left ventricle being the origin of the coordinate system) – would allow the counting rates to be expressed as goniometric functions and shown in graphs. The methods under investigation did, however, not appear to give reasonable approximations to a 'normal range', on the

basis of which it would be possible to make clearer distinctions between scintiscans with and without pathological findings.

51797 (INIS-mf–12126) **Beneficial and adverse effects of irradiation in patients repeatedly subjected to high-dosage treatment.** Roeckelein, I. Erlangen-Nuernberg Univ., Erlangen (Germany, F.R.). Medizinische Fakultaet. 10 Nov 1986. 115p. (In German). Order Number DE90706226. Source: NTIS (US Sales Only), PC A06/MF A01; OSTI; INIS.

During the period between 1978 and 1983 a total of 156 patients showing different types of tumors were subjected to high-dosage radiotherapy. The patients were treated repeatedly for primary or recurrent tumours using a radiation dose of >79 Gy. Each of the three largest groups, which were mammary carcinomas (33), cerebral tumours (25) and orohypopharyngeal tumours (22), was analysed individually. In the majority of patients the local effects of this radiotherapy were such that total or at least partial remission of the primary or recurrent tumour appeared most likely. In the groups receiving doses in the lower range the results were just as good as those achieved in subjects exposed to high doses. The survival times determined here for bearers of mammary or cerebral carcinomas were better than the relevant values given in the literature.

51798 (INIS-mf–12127) **Long-term study on the radiotherapy of squamous cell carcinomas confined to the vocal cord.** Legner, R. Wuerzburg Univ. (Germany, F.R.). Medizinische Fakultaet. 21 Jul 1983. 44p. (In German). Order Number DE90706227. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

It was the aim of this study to compare two different methods of treating carcinomas of the vocal cord, which are ultrahard x-rays or telecobalt on the one hand and radium contact irradiation on the other hand. A clear definition of the therapeutic role of these two techniques is an urgent requirement, in particular in view of the fact that the relative advantages of a radiotherapeutic management of carcinomas of the vocal cord must in each case be carefully balanced against those of surgical intervention.

51799 (INIS-mf–12129) **Structural identification and characterization of monoclonal antibodies to rat angiotensinogen.** Nagel, M. Heidelberg Univ. (Germany, F.R.). Naturwissenschaftlich-Mathematische Gesamtfakultaet. 25 Oct 1984. 102p. (In German). Order Number DE90706228. Source: NTIS (US Sales Only), PC A06/MF A01; OSTI; INIS.

Balb/c mice were immunised in vivo using angiotensinogen obtained from rats. In order to confirm that an immunoreaction had taken place, the concentration of specific antibodies was determined in selected sera on the basis of a radioimmunological method. In view of the fact that affinity of the antibodies of the three monoclonal lines isolated here was calculated to be in the order of $10h^7$ l/mol it appears that their main field of use in affinity chromatography would be the purification of angiotensinogen from rats.

51800 (LBL–27660, pp. 1-5) **Chromatin structure and x-ray imaging: Static and dynamic considerations.** Gray, J.W. (Lawrence Livermore National Lab., CA (USA)); Trebes, J. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

Substantial effort in genetics is now being devoted to determination of the entire sequence of nucleotides for humans and other organisms and investigation of mechanisms that control the replication and translation of DNA. X-ray imaging may play a role in both areas; high resolution analysis may provide information about the DNA sequence itself and intermediate resolution imaging may provide information about the organization of DNA in living cells that may be important to the regulation of replication and gene expression. This paper provides information about DNA structure and organization that may be useful as a guide to the design of X-ray imaging experiments.

51801 (LBL–27660, pp. 6-7) **Research directors in DOE'S life science programs.** Goldstien, G. (Dept. of Energy, Washington, DC (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

The Office of Health and Environmental Research (OHER) is the life sciences research arm of the Department of Energy. The OHER program has two main objectives: (1) to develop the knowledge base necessary to identify, understand, and anticipate the long-term health and environmental consequences to energy use and development; and (2) to utilize the Department's unique scientific and technological capabilities to solve major scientific problems in medicine and biology. In addition to science oriented research aimed at improving our fundamental understanding in areas important to OHER objectives, several large scale multidisciplinary efforts have been mounted addressing key programmatic and societal issues that require a well organized and integrated approach involving a variety of scientific specialties. Some examples are: Human Genome Program; Structural Biology; Radon Research Program; Acid Rain; Global Climate Change and Subsurface Science Program. We anticipate that with the development of new high brightness, coherent synchrotron light sources, and x-ray lasers microimaging techniques will make an important contribution in structural biology research particularly in determining the three-dimensional structure of biological cells and subcellular components.

51802 (LBL–27660, pp. 8-14) **Organization, structure and function of chromosomes.** Bradbury, E.M. (Univ. of California, Davis (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

Although much interest focuses on the mapping and sequencing of genes, non-coding DNA regions clearly contain sequences involved int he organization and functions of chromosomes. The constancy of banding patterns of individual metaphase chromosomes reflects a highly reproducible pattern of long-range DNA folding, most probably directed by specific DNA-protein interactions and possible by unusual DNA structure. Superimposed on this long range order is the packaging of the DNA loops, which involves mainly the histones together with other poorly defined structural and regulatory proteins. A major biological question is how the different packagings of loops might determine the states of different genes families. DNA control regions of active genes must be accessible to gene regulatory proteins whereas regulatory regions of the permanently repressed genes of a particular cell type may be packaged so that they are inaccessible. Such packaging may also determine the availability of DNA regions to chemical damage. Thus, a knowledge of the organization of chromosomes is essential to an understanding of the central processes of differentiation and development as well as the processes of DNA damage in chromosomes. Such information is also essential to the ultimate understanding of chromosome organization in the cell nucleus. It is to be hoped that the x-ray imaging capabilities of the Advanced Light Source will provide images of hydrated chromosomes and nuclei at resolutions down the 10-0 nm.

51803 (LBL–27660, pp. 15-20) **Introduction to x-ray imaging methods.** Sayre, D. (IBM Research Center, Yorktown Heights, NY (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

X-rays have the potential of imaging whole biological cells at nanometer resolution. To realize this potential, high-resolution x-ray imaging techniques suitable for the imaging of general specimens are needed. At present, the only high-resolution x-ray techniques are those of x-ray crystallography and are limited to special types of specimens. This paper provides an introduction to the status and possible future of general high-resolution x-ray imaging methods. Basically the situation is that focussing systems, which are the basis for high-resolution imaging with light and electrons, also exist for x-rays but due to the short wavelengths involved require extremely accurate fabrication. Resolutions at present are near 300A, with

100A regarded as possible in the next few years. To supplement these, methods of imaging which do not use focussing are also being studied. Ultimate resolutions to 30A for focussing methods, and possibly to 10A for non-focussing methods, can be envisaged. These numbers refer to purely optical limitations, however, and resolutions will inevitably be affected by radiation damage as well.

51804 (LBL–27660, pp. 21-41) **Brightness, coherence and imaging at x-ray wavelengths.** Attwood, D. (Univ. of California, Berkeley (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

Biological imaging utilizing scanning x-ray microscopy has recently achieved two significant milestones: (1) spatial resolution well beyond that of the visible light microscope, and (2) images of biologically viable samples in a wet and unmodified state (neither fixed, sectioned not stained). The goal of this microscopy effort is to study a model biological process – that of secretion – with a space-time dynamic capability not previously possible. The tradeoffs between resolution and damage, determinations of short-term functional viability, careful radiation budgeting and microscope engineering will determine the eventual success of this effort.

51805 (LBL–27660, pp. 42-47) **Revolution in x-ray optics.** Ceglio, N.M. (Lawrence Livermore National Lab., CA (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

In the past half decade or so there has been a technological revolution in our ability to generate, control, manipulate, focus, and detect x-rays. The emergence of x-ray lasers and synchrotron insertion devices has increased the brightness of laboratory x-ray sources eight to twelve orders of magnitude over what was available in the late 1960's. In addition, the past few years have been witness to significant advance in the development of normal incidence x-ray mirrors and beamsplitters, diffraction limited x-ray lenses, x-ray microscopy, x-ray holography, x-ray waveguides, and CCD x-ray detector arrays. Utilizing these new capabilities, workers in the field are taking the first steps toward the development of sophisticated soft x-ray optical systems, including soft x-ray interferometers high intensity x-ray lasers and projection optics for x-ray lithography. Details of these developments are discussed in the references listed below. Highlight of the oral presentation are provided.

51806 (LBL–27660, pp. 48-50) **Direct x-ray microimaging.** Kirz, J. (SUNY, Stony Brook, NY (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

X-ray microimaging may be classified into two basic approaches, direct and diffractive imaging. There are several contributions to this workshop concerning diffractive imaging, such as Gabor and Fourier transform holography, and soft X-ray diffraction. In this contribution we provide a brief review of the direct imaging methods, their relative merits, and speculate about future directions of the field.

This paper outlines the talk given at the conference on X-ray Microimaging for the Life Sciences held May 24-26, 1989 in Berkeley, California. Soft x-ray holography offers the possibility of obtaining high resolution, 3-D images of living cells and organelles therein. To achieve a specified resolution, a certain number of photons must be scattered by the smallest features of interest within the samples. This requires a certain irradiating fluence, the magnitude of which depends on the wavelength of the x-rays and the scattering cross-sections of the features. Unfortunately, irradiation of the sample will be accompanied by the absorption of x rays. If the dose is large, the sample will be damaged, possibly compromising the quality of the image. A theoretical study of the scattering and absorption of x rays during the creation of a hologram is described. Using a new prescription for scattering by condensed biological materials within the aqueous environment of a cell, we estimate the irradiating fluence required for a certain resolution and the associated sample dose. The relative merits of different x-ray wavelengths are discussed. A wavelength of about 44 Å, just outside the water window, appears to be optimal in that the required fluence and dose are minimized, while reasonable x-ray penetrability is maintained. Estimates are given for the minimum source energy required and the maximum duration of an exposure to capture an image before blurring due heat induce motion. The use of colloidal gold tagging can enhance image contrast and reduce the required irradiating fluence and sample damage.

51808 (LBL–27660, pp. 57-68) **New biological science with x-ray microimaging.** Rothman, S. (Univ. of California, San Francisco (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. X-ray microimaging represents a comparative method that will both permit us to look at the structures of the cell in a new light, x-radiation, and without the major alternations in the sample required by common electron microscopy. Unlike electron microscopy, x-ray imaging is suited for viewing a wide range of biological structures in their natural state; that is, in the absence of fossilizing preparative procedures or other alterations, save extraction from the tissue or cell of origin. X-ray imaging allows the environmental conditions that are prerequisite for useful dynamic imaging of biological material. The sample can be kept in an aqueous environment at body temperature, whole, and without the addition of foreign substance, such as heavy metals or dyes, to provide imaging contrast. Where proper resolution is not the criterion of merit, one should be able to examine features beyond the resolution limit of x-ray microimaging in much the same way as has been done with visible light microscopy, offering the possibility of gaining information as to location and relative motion of very small objects.

The authors have recently recorded holograms using 19 Å x-rays from the X-1A undulator beamline at the National Synchrotron Light Source. Coherent illumination is obtained through the use of a monochromator and pinhole arrangement, and we can now record holograms with an exposure time of about three minutes. An image of 1.09 μm polystyrene spheres is obtained by numerically reconstructing an x-ray hologram. The spheres appear to be structureless objects, and the image is only slightly corrupted by the twin-image noise inherent in the Gabor holographic geometry. The lack of internal structure in these spheres has been confirmed by viewing them in a 1.5 MeV high voltage transmission electron microscope (HVEM). These images suggest that we can indeed obtain essentially artifact-free images of organic materials.

51810 (LBL–27660, pp. 74-79) **Computational and visible light experiments for X-ray laser holography.** Brase, J.M. (Lawrence Livermore National Lab., CA (USA)); Yorkey, T.J.; Peters, D.C. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). Due to the fact that most biological objects of interest are embedded in a complex three-dimensional environment, it is difficult to estimate the usefulness of x-ray images of complex objects using usual measures of resolution such as Rayleigh criteria. We are approaching this problem for the design and characterization of x-ray holography systems by developing computational tools for the simulation of x-ray hologram formation and for their computational reconstruction. These efforts are closely coupled with a scaled visible light experimental program which validates both the stimulations and the reconstruction techniques. The use of simulations allows us not only to establish resolution limits for complex objects but also to vary the parameter space in a controlled manner to optimize imaging system designs.

51811 (LBL–27660, pp. 80-84) **Genome sequencing by direct imaging x-ray color holography.** Haddad, W. (MCR Technology Corporation, Chicago, IL (USA)); Boyer, K.; Solem, J.C.; Rhodes, C.K.; Moriarty, R.M. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

Currently available techniques for sequencing DNA are inadequate for oligonucleotides of length greater than 600 nucleotides and are most effective in the 300 nucleotide range. Since the full human genetic complement is of vast size, representing $\sim 3 \times 10_9$ bases, a fast and accurate method for DNA sequencing is needed. Therefore, we set as a goal a sequencing rate in the range of $\approx 10^2$ bp/s with an accuracy of ~ 1 error per 10^6 bases, a value exceeding that set by the fidelity of current enzymatic processes. These values would permit the accurate determination of the sequence of the full human genome in one year. An approach involving rapid direct imaging of large segments of DNA is desired. A properly constructed x-ray Fourier-transform holographic microscope appears to combine these features. A basic x-ray holographic instrument has been designed. This concept, with appropriate modifications, and the use of presently available x-ray sources, appears applicable to the task of genome sequencing with a resulting rate of sequence determination in the range of $\sim 10_2$ bp/s.

51812 (LBL–27660, pp. 103-106) **Time-resolved macromolecular crystallography.** Moffat, K. (Cornell Univ., Ithaca, NY (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

Much of our knowledge of the fundamentals of molecular biology comes from analysis of the three-dimensional structure of macromolecules, obtained largely by x-ray crystallographic investigations and more recently, also by two-dimensional nuclear magnetic resonance techniques. Although this approach is achieving notable successes, it has a major limitation. Conventional crystallographic techniques can probe only static structures, and yield a space average over all molecules in the crystal, typically 10^{13} in number, and a time average over the duration of the x-ray exposure. However, the heart of biological processes such as catalysis, during binding, viral uncoating, antigen-antibody recognition, and muscle contraction lies in dynamic changes in structure that extend over a very wide time range, rather that in static structure. How are these dynamic changes in structure to be observed? Techniques are needed that can probe atomic structures in real time, as the biological process is unfolding: time-resolved crystallography. A time-resolved crystallographic experiment has three main components: reaction initiation, reaction monitoring and time-resolved x-ray data acquisition, and data analysis. These components are discussed.

51813 (LBL–27660, pp. 114-121) **The requirements for improvement in biological microscopy.** Pawley, J.B. (Univ. of Wisconsin, Madison (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

Striking technical advances in X-ray sources and X-ray optics now make it possible to produce X-ray images under conditions thought impossible only a few years ago. However, major questions remain as to whether this new instrumentation can find useful application in elucidating biological structure. On the whole, given the sampling problem (implied by the immense cost of the sources needed for X-ray microscopy) the lack of any significantly new contrast mechanisms, the relative inefficiency of the lenses and detector system, and the strong competition from other microtechniques, it is hard to identify a potentially useful role for X-ray microscopy in biology at this time.

51814 (LBL–27660, pp. 122-126) **High Brightness x-rays from undulators and wigglers.** Winick, H. (Stanford Synchrotron Radiation Laboratory, CA (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

Electrons in circular motion at low velocity emit radiation in a non-directional pattern. At velocities approaching the velocity of light the radiated power increases dramatically and the pattern is folded forward into a cone with a full opening angle of approximately $2\gamma^{-1} = 2mc^2/E$, where mc^2 is the rest mass energy of the electron (0.51 MeV) and E is the total energy. The opening angle is only 1 milliradian for an electron energy of 1 GeV and correspondingly smaller at higher electron energy. Thus synchrotron radiation has intrinsically high brightness (flux per unit source area per unit solid angle). This geometrical property is exploited differently when the source is a bending magnet, a wiggler, or an undulator. The total power radiated is given by $P(\kappa W) = 1.267E^2\ (GeV)I(A) < B^2(T) > L(m)$ where $< B^2\ (T) >$ is the magnetic field in Tesla averaged over the length L in meters, allowing for constant fields (bending magnets) or alternating (wiggler and undulator magnets). For sinusoidal fields $<B^2>$ is replaced by $B_0{}^2/2$, where B_0 is the peak field.

This study will describe progress to date in the field of x-ray lasers and the application of the soft x-ray lasers and the application of the soft x-ray lasers to microscopy. Soft x-ray lasers offer unique features which complement other light sources and microscopic techniques. We will describe the different techniques for generating a population inversion and producing an soft x-ray laser and review the progress to date and near term prospects in increasing the output power and progressing to shorter wavelengths. We want to stress that we don't see this as a competition between the different techniques. Getting detailed information about life processes inside cells is a challenging task and the more techniques available to obtain that information the better.

51816 (LBL–27660, pp. 132-141) **The development of coherent x-ray lasers for x-ray holography.** Matthews, D.L. (Lawrence Livermore National Lab., CA (USA)); Trebes, J.; London, R.; Rosen, M. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

We will describe several of our research paths to develop an x-ray laser capable of producing the flux required to obtain x-ray holograms of biological structures in live cells. These paths include optimization of our current Ni-like Yb laser which operates at 5.02 nm as well as the introduction of a new Ni-like Ta laser which operates at 4.48 nm, i.e., is the near optimum wavelength for holographic imaging of biological objects. Current predictions indicate that we will need to produce at least 20 μJ of spatially-coherent radiation in a pulselength of 50 psec and focussed at the sample to a beam of 10 μm diameter. We will provide a detailed description of how we hope to meet these requirements. In addition, some

comments will be given on future trends in x-ray laser development, namely towards more efficient table top systems.

51817 (LBL–27660, pp. 142-148) **Feasibility/biological applications of neutron microscopy.** Drukier, A.K. (Univ. of Maryland, College Park (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

The neutron microscope is a new instrument permitting a better understanding of life processes at subcellular levels, e.g., in genetics, cell biology, physiology and pharmacology. New knowledge and understanding of biological functions at the organ and organism level are possible, e.g., real time, high spatial resolution distribution of nitrogen. The neutron microscopes using cold neutrons were built in W. Europe and the USSR, but their performances are severely limited by existing neutron detectors. To obtain submicron spatial resolution and to shorten the time necessary to obtain the image, we suggest the use of a new high spatial resolution imager: The superconducting granular detector (SGD). Using cryogenic techniques neutron detector with a few micron spatial resolution (2048 X 2048 pixels) can be developed and would permit the neutron microscopy with submicron resolution.

51818 (LBL–27660, pp. 158-165) **Status of the plasma focus source for the laboratory type imaging microscope.** Neff, W. (FhG-Institut fuer Lasertechnik, Steinbachstr, Aachen (West Germany)); Holz, R.; Richter, F.; Leber, R. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

A plasma focus operating in nitrogen is developed as an x-ray source for the laboratory type x-ray microscope. The radiation has to be emitted into the water window (2.4 nm - 4.4 nm) with a reciprocal relative bandwidth (RDB) of $\lambda/\delta\lambda > 200$. The nearly coinciding Lyman-α line of nitrogen VII λ = 2.48 nm and the second resonance line of nitrogen VI at λ = 2.49 nm are chosen. For the use in the microscope the end on diameter of the source has to be about 200 μm with a spatial jitter below 100 μm. A first version of the source including beamline and condenser stage has been tested. Spatial, temporal and spectral properties of the source have been investigated. With a pinhole-grating spectrograph spatial and spectral information are obtained simultaneously. First experiments with Fresnel condenser ozone plates (CZP) as a tool for plasma soft X-ray emission diagnostics are presented. Experimental results show that the gas in the beamline can be used as a filter for undesired radiation. With improved efficiency of the zone plates and x-ray detectors the expected plasma emission of about 1 J into the full solid angle from a source with a diameter of 200 μm should be sufficient to achieve an exposure with one pulse.

51819 (LBL–27660, pp. 174-177) **Microscopy with x-ray lasers.** Rosser, R.J. (Princeton Univ., NJ (USA)); DiCicco, D.S.; Skinner, C.H.; Suckewer, S. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

This study will describe the progress to date in applying the soft x-ray laser to imaging biological specimens. X-ray lasers offer the exciting prospect of enabling the study of dynamic processes in living cells. This arises naturally from the nanosecond duration of the soft x-ray laser pulse. One would sequentially take many flash images of living cells and later order them to form the sequence of action. The individual cells would not survive the exposure but radiation damage to structures inside the cell would not change their shape during the nanosecond exposure times. There are many processes occurring on millisecond time scales that would be ideal subjects for a flash image using a pulsed x-ray laser. Of course there is a high intensity limit beyond which the cell becomes a laser produced plasma and all structural information is lost, but this is only a significant problem at resolutions approaching the molecular level.

51820 (LBL–27660, pp. 178-183) **Short wavelength FELs as high brilliance sources.** Shay, H.D.; Barletta, W.A.; Yu, S.; Scharlemann, E.T.; Schlueter, R.; Deis, G. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

The concept of using a high gain FEL amplifiers with electron beams accelerated in high gradient structures powered by relativistic kylstrons is presented. Other authors have also considered x-ray FELs; the unique aspect of this paper is the use of high gradient acceleration. The wavelength, power, and pulse width requirements stem from the objective of viewing biological structures in an aqueous environment with tomographic or holographic microscopy having resolution of several tens of nanometers over a field of view of about ten microns. London, et al., have shown that the greatest ration of signal to dose occurs at a wavelength of about 44Å, at the carbon K-edge and that, at this wavelength, scattering from a protein sphere of 15nm diameter has a cross section of about 10^{-14}cm^2. For adequate signal strength, about 1000 photons should be scattered per solution element. These numbers imply that the incident x-ray fluence should be about 10^{18}photons/cm^2, about 45J/cm^2. The energy absorption resulting from this fluence is so great that significant blurring would occur if the exposure were any longer than about 30ps. With the FEL architecture under consideration here, the natural pulse length is 1-10ps, and so the required FEL peak power would be about 5-50MW.

51821 (LBL–27660, pp. 185-196) **The potential of PEP as a high-brightness soft x-ray source for coherence and micro-imaging studies.** Tatchyn, R. (Stanford Univ., CA (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

The Stanford Positron Electron Project (PEP) offers a number of technical advantages that, if properly exploited, can make it the brightest and most versatile soft x-ray source in the world for research in coherence and micro-imaging. Among these advantages are (1) the existence of long straight sections and high operating energies, which allows the development and installation of advanced weak-field undulators for versatile, polarized soft x-ray generation; (2) a possible emittance upgrade, utilizing a damping wiggler lattice, which would yield emittances of a fraction of 1 nm-rad, leading to the emergence of a new, coherent, mode of spontaneous synchrotron radiation (SR) emission; and (3) the possibility of applying longitudinal pulse compression techniques to possibility of applying longitudinal pulse compression techniques to lengths, greatly enhancing the temporal resolution of single-shot x-ray imaging. In this presentation, these and other features of PEP are graphically presented, and a brief enumeration and discussion of their application to advanced research in x-ray coherence and micro-imaging technology is given.

51822 (LBL–27660, pp. 197-202) **Super-high resolution holographic composite polymer grafts for XUV applications.** Savant, G. (Physical Optics Corporation, Torrance, CA (USA)); Jannson, T. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

Advancement of holographic technology into the XUV brings with it many technical challenges. The resolution, optical quality and environmental stability of holographic materials become crucial issues at shorter wavelengths. Recent developments of a new class of XUV holographic materials based on graft concepts at Physical Optics Corporation (POC) point the way toward development of XUV holographic optical elements featuring high efficiency, high optical quality, conventional and unconventional functions, strong resistance to adverse environments and cost effectiveness.

51823 (LBL–27660, pp. 184) **X-ray microscope with free-standing zone plates at UVSOR (Japan).** Kihara, Hiroshi (Jichi Medical School, Minamikawachi, Tochigi (Japan)); Shimanuk,

Yoshio; Kawasaki, Kenzo; Watanabe, Noric; Taniguch, Mieko; Tsuruta, Hirotsugu; Nagai, Yoshinori; Watanabe, Yutaka; Ogura, Shigetaro. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192--: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

To develop X-ray microscope in VUV region, the use of a free standing zone plate is inevitable. Thus, we have fabricated free-standing zone plate, and tested its focal an magnifying features. The test system was applied for the observation of mesh and dried biospecimens such as diatoms. The present characteristics of the zone plates are: n=312, f=150 mm at 8 nm light, dr_n= 0.93 μm, and Au thickness = 2 μm with a central mask of 0.2 mm as a condenser zone plate. The same dimensional zone plate without masks was used as a micro zone plate. We have tested zone plate imagings with two types of set-ups. One is with a plant-grating monochromator and a zone plate with central mask at the beam line 6A2 of UVSOR, and the other is with the zone plates (with and without a mask) without a monochromator beam line 8A of UVSOR was used. Detectors (MCP or films) were located 2863.5 mm from MZP, which has a magnification ratio 13.4, unless otherwise stated. MEM or Minicopy films were used. Two types of MCP were used with a singled layer or double layers. Obtained images were observed on fluorescent screen, which was usually monitored with SIT camera for accumulation. The Cu No. 1000 mesh image and other biological samples were taken.

51824 (LUMEDW-MEXL-1021-1990) **Diagnostic and interventional radiology in gynecologic neoplasms.** Thorvinger, B. Lund Univ. (Sweden). Dept. of Diagnostic Radiology. May 1990. 18p. Order Number DE91604398. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The role and clinical value of the modern radiologic methods for evaluation of gynecologic tumors is not finally settled. The aims of our investigation were therefore to compare clinical examination with CT in patients with possible recurrence of cervical carcinoma; to evaluate the usefulness of CT in patients with fistulas following gynecologic tumors or their treatment; to evaluate the ability of transabdominal US and MR imaging in intrauterine staging including myometrial invasion on patients with endometrial carcinoma; to evaluate CT in the capacity of monitoring therapy response, probable recurrence or clinical remission in patients with ovarian carcinoma; and to evaluate the effect of intraarterial occlusion in facilitating surgery and in evaluating the role of the intraarterial infusion in gynecologic tumors otherwise refractory to all therapy given. CT was more accurate (91%) than clinical pelvic examination (78%) in revealing extensive disease after radiation and/or surgical treatment. CT was also a most valuable tool in demonstrating genital fistulas following gynecologic malignancy or its treatment. Transabdominal US did not improve staging in early endometrila carcinoma while MR had potential for delineating intrauterine tumor growth (accuracy for myometrial invasion 95%). CT was most valuable in the evaluation of therapeutic response of ovarian malignancy. For possible recurrence or in clinical remission, only positive CT was of clinical significance. The potentials of transcatheter intraarterial management in order to facilitate operability are also discussed. (92 refs.).

51825 (ORNL/FTR-3749) **[Coordinated research programs in nuclear medicine]: Foreign trip report, September 8, 1990-September 17, 1990.** Knapp, F.F. Jr. Oak Ridge National Lab., TN (USA). 3 Oct 1990. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE91000875. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler visited the Clinic for Nuclear Medicine at the University of Bonn, West Germany, to review, organize, and plan collaborative studies. He also met with the editorial board of the journal NucCompact – European/American Communications in Nuclear Medicine, on which he serves as US editor. He also visited colleagues at the Cyclotron Research Center (CRC) at the University of Liege, Belgium, to coordinate clinical applications of the ultrashort-lived iridium-191m radionuclide obtained from the osmium-190/iridium-191m generator system. The traveler planned and coordinated continuing collaboration with colleagues at the CRC for further applications of this generator system. He also visited the University of Metz, Metz, France, to organize a three-center project for the synthesis and evaluation of various receptor-specific cerebral imaging agents, involving the Oak Ridge National Laboratory (ORNL), CRC, and the University of Metz.

51826 Uptake of a certain nidocarboranyl porphyrin by human glioma xenografts in athymic nude mice and by syngeneic ovarian carcinomas in immunocompetent mice. Kahl, S.B. (Univ. of California, San Francisco (USA)); Joel, D.D.; Nawrocky, M.M.; Micca, P.L.; Tran, K.P.; Finkel, G.C.; Slatkin, D.N. pp. 149, Paper INOR 513 of American Chemical Society, Division of Inorganic Chemistry. American Chemical Society, Washington, DC (US) (1990). pp. 229 (CONF-900402--: 199. national meeting of the American Ceramic Society, Boston, MA (USA), 22-27 Apr 1990).

We report strategies for the synthesis and testing of a certain tetraphenylporphyrin bearing four $B_9C_2H_{11}^-$ cages linked by anilide bonds to the ortho ring positions (BTPP). Boron uptake was measured in human gliomas xenografted into athymic nude mice and in syngeneic ovarian carcinomas in immunocompetent mice treated with BTPP by slow infusion. Bulk boron concentrations up to 34 μg glioma and 45 μg/g carcinoma were observed, and were accompanied by moderate hepatoxicity and thrombocytopenia. These studies further characterize BTPP as a candidate boron transport agent for boron neutron capture therapy (BNCT) of human gliomas and perhaps other malignancies.

51827 Single photon emission computed tomography. Budinger, T.F. (Div. of Research Medicine and Radiation Biophysics, Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). pp. 108-127 of Diagnostic nuclear medicine. Second edition: The challenge for the next decade. Volume 35. Gottschalk, A.; Hoffer, P.B.; Potchen, E.J.; Berger, H.J. Williams and Wilkens, Baltimore, MD (USA) (1988). pp. 1154

This chapter presents an explanation of emission tomography by describing longitudinal and transverse section tomography. In principle all modes of tomography can be considered under the general topic of coded apertures, wherein the code ranges from translation of a pinhole collimator to rotation of a parallel hole or focused collimator array. Single photon emission computed tomography and positron emission tomography comprise emission tomography. Single photon tomography uses collimator systems for detection of gamma photons from radionuclides, and is divided into longitudinal or limited-angle tomography and transverse section tomography. The majority of new developments and practical applications use transverse section tomography, which gives results similar to those of PET and shares with PET the physical problems of attenuation, angular sampling requirements, nonuniformity of resolution, scatter, and statistical limitations. The severity of these problems is greater for SPECT than for PET; however, they can be compensated for through instrument design and mathematical treatment of the data.

51828 Pediatric cardiovascular nuclear medicine. Kuruc, A.R. (Children's Hospital, Harvard Medical School, Boston, MA (US)); Treves, S. pp. 414-426 of Diagnostic nuclear medicine. Second edition: The challenge for the next decade. Volume 35. Gottschalk, A.; Hoffer, P.B.; Potchen, E.J.; Berger, H.J. Williams and Wilkens, New York, NY (USA) (1988). pp. 1154

This paper reports on pediatric first-pass radionuclide angiocardiography, used primarily for the detection, localization, and quantitation of circulatory shunting. This examination provides information regarding gross anatomy and blood flow patterns. Other quantitative applications of this procedure include estimation of ventricular volumes and ejection fractions, cardiac output, and transit times between the various cardiopulmonary structures. The procedure is minimally invasive, carries almost no risk, does not produce significant hemodynamic disturbance, and delivers a low dose of radiation. It is therefore useful as a screening test, prior to more invasive diagnostic procedures, and as follow-up test that may be used repeatedly to follow patients on a long-term basis. The use of portable gamma camera computer systems allows the study to be performed at bedside, if necessary.

51829 Graphical analysis of reversible radioligand binding from time-activity measurements applied to [N-^{11}C-methyl]-(-)-cocaine PET studies in human subjects. Logan, J. (Brookhaven National Laboratory, Upton, NY (USA)); Fowler, J.S.; Volkow, N.D.; Wolf, A.P.; Dewey, S.L.; Schlyer, D.J.; MacGregor, R.R.; Hitzemann, R.; Bendriem, B.; Gatley, S.J. *Journal of Cerebral Blood Flow and Metabolism (USA),* 10(5): 740-747 (Sep 1990).

A graphical method of analysis applicable to ligands that bind reversibly to receptors or enzymes requiring the simultaneous measurement of plasma and tissue radioactivities for multiple times after the injection of a radiolabeled tracer is presented. It is shown that there is a time t after which a plot of integral of t0ROI(t')dt'/ROI(t) versus integral of t0Cp(t')dt'/ROI(t) (where ROI and Cp are functions of time describing the variation of tissue radioactivity and plasma radioactivity, respectively) is linear with a slope that corresponds to the steady-state space of the ligand plus the plasma volume,.Vp. For a two-compartment model, the slope is given by lambda + Vp, where lambda is the partition coefficient and the intercept is -1/[kappa 2(1 + Vp/lambda)]. For a three-compartment model, the slope is lambda(1 + Bmax/Kd) + Vp and the intercept is -(1 + Bmax/Kd)/k2 + [koff(1 + Kd/Bmax)]-1 [1 + Vp/lambda(1 + Bmax/Kd)]-1 (where Bmax represents the concentration of ligand binding sites and Kd the equilibrium dissociation constant of the ligand-binding site complex, koff (k4) the ligand-binding site dissociation constant, and k2 is the transfer constant from tissue to plasma). This graphical method provides the ratio Bmax/Kd from the slope for comparison with in vitro measures of the same parameter. It also provides an easy, rapid method for comparison of the reproducibility of repeated measures in a single subject, for longitudinal or drug intervention protocols, or for comparing experimental results between subjects. Although the linearity of this plot holds when ROI/Cp is constant, it can be shown that, for many systems, linearity is effectively reached some time before this. This analysis has been applied to data from [N-methyl-11C]-(-)-cocaine studies in normal human volunteers and the results are compared to the standard nonlinear least-squares analysis.

51830 Biosynthesis of the manumycin group antibiotics. Thiericke, R. (Universitaet Goettingen (West Germany)); Zeeck, A.; Nakagawa, Akira; Omura, Satoshi; Herrold, R.E.; Wu, S.T.S.; Beale, J.M.; Floss, H.G. *Journal of the American Chemical Society (USA),* 112(10): 3979-3987 (9 May 1990).

The biosynthesis of the manumycin group antibiotics manumycin (1) and asukamycin (2) was studied in Streptomyces parvulus Tue 64 and Streptomyces nodosus ssp. asukaensis ATCC 29,757 by using radioactive and stable isotope tracer techniques and high-field NMR spectroscopy. The results have demonstrated that the central, multifunctional mC_7N unit typical of this group of antibiotics, which serves as the starter unit for a short polyketide chain, is biosynthesized from a C_4 Krebs cycle and a C_3 triose phosphate pool intermediate by a new pathway, distinct from the shikimate, polyketide, or pentose phosphate routes leading to other mC_7N units in nature. The C_5 unit in both 1 and 2 arises by a novel intramolecular cyclization of 5-aminolevulinic acid, and a cyclohexane ring and the adjacent carbon in 2 arise from the seven carbon atoms of shikimic acid. The side chains of both antibiotics represent typical polyketide-derived moieties, differing with respect to their combinations of starter and elongation units.

51831 Technetium(V) and rhenium(V) complexes of 2,3-bis(mercaptoacetamido)propanoate. Chelate ring stereochemsitry and influence on chemical and biological properties. Rao, T.N. (NeoRx Corp., Seattle, WA (USA)); Adhikesavalu, D.; Camerman, A.; Fritzberg, A.R. *Journal of the American Chemical Society (USA),* 112(15): 5798-5804 (18 Jul 1990). DOE Contract AC02-83ER60140.

Monoxo complexes of technetium(V) and rhenium(V) with 2,3-bis(mercaptoacetamido)propanoate (map) have been synthesized. The complexes with general formula $[Ph_4X][MO(map)]$ (where X = As, P; M = Tc, Re) were characterized by IR, visible-UV spectra, and negative ion fast atom bombardment spectroscopy. The chelate ring epimers were separated by HPLC (semipreparative reverse-phase C_{18}) isolated and crystallized as salts of $[Ph_4X][MO(map)]$. The structures of the two epimers (syn and anti) of technetium and one of the epimers (syn) of the rhenium complexes were determined by single-crystal X-ray analyses. All three complexes crystallize in the space group $P2_1/c$ and have four formula units in the unit cell. In all of the three complexes, the metal (Tc, Re) is coordinated to one oxygen (yl) atom, two sulfur (thiolate) atoms, and two nitrogen atoms (amide) in a distorted square-pyramidal geometry. The position trans to the oxygen (yl) atom is vacant.

51832 Radiohalogenated thienylethylamine derivatives for evaluating local cerebral blood flow. Goodman, M.M.; Knapp, F.F. Jr. To Dept. of Energy, Washington, DC (USA). USA Patent 4,900,539/A/. 13 Feb 1990. Filed date 22 Dec 1988. USA Patent patents application 7-288,349. Int. Cl. A61K 49/02. 4p. Source: Patent and Trademark Office, Box 9, Washington, DC 20232 (USA).

This patent describes radiopharmaceuticals useful in brain imaging. They comprise radiohalogenated thienylethylamine derivatives. The compounds are 5-halo-thiophene-2-isopropyl amines able to cross the blood-brain barrier and be retained for a sufficient length of time to allow the evaluation or regional blood flow by radioimaging of the brain.

51833 Method for nuclear magnetic resonance imaging using deuterum as a contrast agent. Kehayias, J.J.; Joel, D.D.; Adams, W.H.; Stein, H.L. To Dept. of Energy, Washington, DC (USA). USA Patent 4,893,627/A/. 16 Jan 1990. Filed date 26 May 1988. USA Patent patents application 7-200,811. Int. Cl. A61B 5/05. 4p. Source: Patent and Trademark Office, Box 9, Washington, DC 20232 (USA).

This patent describes a method for in vivo NMR imaging of the blood vessels and organs of a patient characterized by using a dark dye-like imaging substance consisting essentially of a stable, high-purity concentration of D_2O in a solution with water.

51834 Development of avian sarcoma and leukosis virus-based vector-packaging cell lines. Stoker, A.W. (Univ. of California, Berkeley (USA)); Bissell, M.J. *Journal of Virology (USA),* 62(3): 1008-1015 (Mar 1988). DOE Contract AC03-76SF00098.

The authors have constructed an avian leukosis virus derivative with a 5′ deletion extending from within the tRNA primer binding site to a SacI site in the leader region. The aim was to remove cis-acting replicative and/or encapsidation sequences and to use this derivative, RAV-1Ψ^-, to develop vector-packaging cell lines. They show that RAV-1Ψ^- can be stably expressed in the quail cell line QT6 and chicken embryo fibroblasts and that it is completely replication deficient in both cell types. Moreover, they have demonstrated that QT6-derived lines expressing RAV-1Ψ^- can efficiently package four structurally different replication-defective v-src expression vectors into infectious virus, with very low or undetectable helper virus release. These RAV-Ψ^--expressing cell lines comprise the first prototype avian sarcoma and leukosis virus-based vector-packaging system. The construction of our vectors has also shown us that a sequence present within gag, thought to facilitate virus packaging, is not necessary for efficient vector expression and high virus production. They show that quantitation and characterization of replication-defective viruses can be achieved with a sensitive immunocytochemical procedure, presenting an alternative to internal selectable vector markers.

51835 Identification of the gene coding for the precursor of adenovirus core protein X. Weber, J.M. (Universite de Sherbrooke, Quebec (Canada)); Anderson, C.W. *Journal of Virology (USA),* 62(5): 1741-1745 (May 1988).

Nucleoprotein complexes extracted from infected cells or ts1 virions grown at 39°C contain, in addition to known virion proteins, a polypeptide with a molecular weight of 11,000 (11K polypeptide). The authors identified the gene for this polypeptide by sequence analysis of the radioactively labeled 11K polypeptide isolated from ts1 virions and comparison of this sequence with the nucleotide sequence of the adenovirus type 2 genome. The 11K polypeptide was encoded by an open reading frame of 80 residues located between nucleotides 17,676 and 17,915 in late transcription region 2

of adenvirus type 2; the initiating methionine residue was removed leaving a 79-residue product. The late transcription region 2 that encoded the 79-residue polypeptide (11K) was arginine rich (21%) and had a predicted molecular weight of 8,715. It was cleaved by the viral endoprotease to give two products which comigrated on sodium dodecyl sulfate-polyacrylamide gels as virion polypeptide X. The data suggest that additional cleavage of the carboxy-terminal 48-residue fragment generates a 19-amino-acid fragment with the amino acid composition of mu.

51836 (AD-A-223638/8/XAB) **Pathophysiology and toxicokinetic studies of blue-green algae intoxication in the swine model. Annual report, 1 September 1987-31 August 1988.** Beasley, V.R.; Haschek-Hock, W.M.; Carmichael, W.W.; Cook, W.O.; Dahlem, A.M. Illinois Univ., Urbana, IL (USA). 26 Sep 1989. 160p. Contract DAMD17-85-C-5241. Source: NTIS, PC A08/MF A01.

An attempt by New England Nuclear to produce radiolabelled MCLR involved synthetic labelling using tritiated water and Rh/Al_2O_3. Chromatography and mass spectrometry revealed radiolabel incorporation into both the toxin and contaminants. The nonspecifically tritiated toxin had a specific activity of 05 uCi/mg. Subsequently, a method recommended by our laboratory utilizing tritiated water with pyridine was performed by New England Nuclear; however, decomposition of the toxin occurred under the conditions used. MCLR was highly bound when added to superactivated charcoal at 1:100. When given to rats via an ileal loop shortly after toxin administration, superchar settled out, but was partially effective in limiting MCLR absorption (as indicated by increases in liver weight).

51837 (DOE/BP/35585–3) **Augmented fish health monitoring: Annual report.** Warren, J.W. Fish and Wildlife Service, Portland, OR (USA). 15 Aug 1990. 132p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract AI79-87BP35585. Order Number DE91000757. Source: NTIS, PC A07/MF A01 - OSTI; GPO Dep.

Augmented Fish Health Monitoring Contract AI79-87BP35585 was implemented on July 20, 1987. This report briefly describes third-year work being done to meet contract requirements for fish disease surveillance at Service facilities in the Columbia River basin and for histopathological support services provided to participating state agencies. It also summarizes the health status of fish reared at participating Service hatcheries and provides a summary of case history data for calendar year 1989. Items of note included severe disease losses to infectious hematopoietic necrosis (IHN) in summer steelhead trout in Idaho, the detection of IHN virus in juvenile spring chinook salmon at hatcheries on the lower Columbia River, and improved bacterial kidney disease (BKD) detection and adult assay by enzyme-linked immunosorbent assay (ELISA) technology at the Dworshak Fish Health Center. Complete diagnostic and inspection services were provided to 13 Columbia River Basin National Fish Hatcheries. Case history data was fully documented in a computerized data base for storage and analysis and is summarized herein. 2 refs., 1 fig., 4 tabs.

51838 **Root versus shoot biomass: Responses to water, nitrogen, and phosphorus applications for Agave lechuguilla.** Nobel, P.S. (Univ. of California, Los Angeles (USA)); Quero, E.; Linares, H. *Botanical Gazette (Chicago) (USA),* 150(4): 411-416 (Dec 1989). DOE Contract FC03-87ER60615.

Shoot and root growth of Agave lechuguilla, a Crassulacean acid metabolism (CAM) succulent widespread in the Chihuahuan Desert, was examined under natural conditions and with two watering regimes, five treatments involving N application to the soil surface, and three treatments involving P application. Under natural conditions root of A. lechuguilla made up only 3.7% of the total plant dry weight, suggesting that this species may be especially sensitive to changes in soil resources. Over the 2-yr study period, increasing the availability of soil water by weekly irrigation increased shoot dry weight of A. lechuguilla by 40% and root dry weight by 75%, which represented a doubling of the increment in plant growth compared with control plants receiving only rainfall. This doubling is consistent with changes in the Water Index (a relative measure of net CO_2 uptake that has a maximum value of unity under wet conditions), which was predicted to be twice as large for the irrigated condition. The greater enhancement of root compared with shoot growth caused by increased water availability should lead to slightly more water uptake, which can compensate for the slightly greater reliance on daytime CO_2 uptake by A. lechuguilla under wet conditions. The leaf N level tended to rise with the application level of N, the increase being 15% at 500 kg N ha^{-1}, whereas the leaf P level was little affected by P applications up to 500 kg ha^{-1}. Application of 100 kg N ha^{-1} increased shoot dry weight by 51% over the 2-yr study period with no effect on root dry weight, and application of 500 kg P ha^{-1} increased shoot dry weight by 40% but decreased root dry weight by 37%. At these application levels, which were optimal for shoot growth, the roots of A. lechuguilla made up only about 2% of the total plant dry weight.

51839 (DOE/CE/15270–T15) **Explorations of mechanisms regulating ectomycorrhizal colonization of boron-fertilized pine: Quarterly report, October 1, 1990–December 31, 1990.** Garrett, H.E.; Sword, M.A. Missouri Univ., Columbia, MO (USA). [1990]. 15p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FG01-86CE15270. Order Number DE91000032. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This progress report discusses activities for the period 10/1/90–12/31/90. Continued data analysis and interpretation have been delayed; but will resume as time permits. Foliar cytokinin and mineral nutrient analyses will be performed following identification of satisfactory analytical procedures. Caffeic acid was chosen as a model phenolic compound for complex identification trials. Fluorometric methods were used for observation of the effect of boric acid on caffeic acid. High performance liquid chromatographic techniques have been initiated for further identification of the potential boric acid-caffeic acid complex. A greenhouse experiment has been installed for evaluation of the biological effects of boric acid on shortleaf pine seedlings. 5 figs., 3 tabs.

51840 (HCR-CDTN–13) **Use of progesterone radioimmunoassay techniques for improving reproduction performances in dary catties.** Benyoucef, M.T. (Haut Commissariat a la Recherche, Algiers (Algeria)); Benabdelaziz, A.; Khelili, R. Haut Commissariat a la Recherche, Algiers (Algeria). Centre de Developpement des Techniques Nucleaires. Jul 1990. 18p. (In French). Order Number DE91604236. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

This report deals with the first measurements of progesterone, by radioimmunoassay (P4-PIA) in blood samples, to assess fertility in livestock (cattle) in Algeria, by improvement of the level of reproduction management. For this purpose, the results obtained throughout first analysis of P4 on a sample of 15 bovines females, composed by 12 heifers and 3 cows confirm the efficiency of the techniques in improving dary cattle reproduction performances. Ovarian activity can be determined for cows at the moment of post partum and for heifers before breeding as well as, pregnancy confirmation on breeding heifers. It is interesting to extend the experiments using these techniques to a higher number of livestocks

(breeds and species) and to develop new research subjects in this field.

51841 (ORNL/Sub–86-91324/1) **Improving rapeseed production practices in the southeastern United States: Final project report.** Thomas, D.L. (Georgia Univ., Tifton, GA (USA). Georgia Coastal Plain Experiment Station); Breve, M.A.; Raymer, P.L.; Minton, N.A.; Sumner, D.R. Oak Ridge National Lab., TN (USA); Georgia Univ., Tifton, GA (USA). Georgia Coastal Plain Experiment Station. Apr 1990. 42p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE90017900. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Oilseed rape or rapeseed is a crop which offers a potential for double-cropping in the southeastern United States. This final project report describes the results from a three year study aimed at evaluating the effect of different planting and harvesting practices on establishment and yield of three rape cultivars, and the double cropping potential of rapeseed in the southeastern United States. The project was conducted on two yield sites in Tifton, Georgia during 1986–87, 1987–88 and 1988–89. The general objective of this research is to improve the seed and biomass yield of winter rapeseed in the southeastern United States by developing appropriate agronomic practices for the region. The primary constraint is to grow rapeseed within the allowable period for double cropping with an economically desirable crop, such as peanut or soybean. Planting and harvesting are the most critical steps in this process. Therefore, the specific objectives of this research were: evaluate and improve the emergence of rapeseed by developing planting techniques that enhance the soil, water and seed regimes for winter rapeseed in the southeast, and evaluate and improve the yields of harvested rapeseed by developing techniques for determining the optimum timing of harvest and efficient methods for harvesting winter rapeseed in the southeast. 6 refs., 12 figs., 9 tabs.

51842 (RERF-TR–3-90) **An improved method for detecting genetic variation in DNA using denaturing gradient gel electrophoresis.** Takahashi, Norio; Hiyama, Keiko; Kodaira, Mieko; Satoh, Chiyoko. Radiation Effects Research Foundation, Hiroshima (Japan). May 1990. 18p. Order Number DE91712969. Source: NTIS (US Sales Only), PC A03/MF A01.

We have examined the feasibility of denaturing gradient gel electrophoresis (DGGE) of RNA:DNA duplexes to detect variations in genomic and cloned DNAs. The result has demonstrated that use of RNA:DNA duplexes makes DGGE much more practical for screening a large number of samples than use of DNA:DNA heteroduplexes, because preparation of RNA probes is easier than that of DNA probes. Three different ^{32}P-labeled RNA probes were produced. Genomic or cloned DNAs were digested with restriction enzymes and hybridized to labeled RNA probes, and resulting RNA:DNA duplexes were examined by DGGE. The presence of a mismatch(es) was detected as a difference in the mobility of bands on the gel. The experimental conditions were determined using DNA segments from cloned normal and three thalassemic human β-globin genes. The results from experiments on the cloned DNAs suggest that DGGE of RNA:DNA duplexes will detect nucleotide substitutions and deletions in DNA. In the course of these studies, a polymorphism due to a single-base substitution at position 666 of IVS2 (IVS2-666) of the human β-globin gene was directly identified using genomic DNA samples. A study of 59 unrelated Japanese from Hiroshima was undertaken in which the frequency of the allele with C at IVS2-666 was 0.48 and that of the allele with T was 0.52. This approach was found to be very effective for detecting heritable variation and should be a powerful tool for detecting fresh mutations in DNA, which occur outside the known restriction sites. (author).

51843 (CONF-9006220–4) **Protection by WR-2721 and WR-151327 against late effects of gamma rays and neutrons.** Grdina, D.J.; Carnes, B.A.; Nagy, B. Argonne National Lab., IL (USA). [1990]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 28. COSPAR plenary conference; The Hague (Netherlands); 25 Jun - 6 jul 1990. Order Number DE90017792. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Two thiophosphoroate compounds WR-2721 and WR-151327 were assessed for their ability to modify the deleterious effects (life shortening and carcinogenesis) of fission-spectrum neutrons or gamma rays on B6CF1 hybrid mice. Male and female mice were irradiated individually at 110 days of age. Radioprotectors were administered intraperitoneally 30 min prior to irradiation. Animals were housed five to a cage; cage locations in the holding rooms were randomized by computer. Animals were checked daily and all deceased animals were necropsied. WR-2721 afforded protection against both neutron- and gamma-ray-induced carcinogenesis and subsequent life shortening. Cumulative survival curves for unirradiated mice of either sex were unaffected by protectors. 28 refs., 6 figs.

51844 (CRIE-U–89041) **Development of technology for plantlet propagation by tissue culture. 1.: Effect of plant hormones on strawberry callus formation and their regeneration.** Yoshihara, T.; Hanyu, H. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Dec 1989. 30p. (In Japanese). Order Number DE91701406. Source: NTIS (US Sales Only), PC A03/MF A01.

For mass propagation of strawberry seedlings via callus by liquid culture method with a higher cultural efficiency, it is required to form calluses which are dispersed homogeneously in liquid culture and are easy to isolate to individual. Then an investigation on the effect of plant hormones on callus formation was conducted. Sorts and concentrations of plant hormones, regeneration ratio from the callus, and the frequency of morphological mutations of the plantlets were examined. Auxins; 2,4-dichlorophenoxy acetic acid (2,4-D) and two others, and cytokinins; kinetin (KIN) and two others were used for plant hormones. These hormones were tested in serial concentrations between 0 to 5 ppm and in combinations with each auxins and cytokinins. Cytokinins were better to form and grow the callus in the vicinity of 0.2ppm, and auxins gave the highest growth rate of callus at 0.5 to 2 ppm. It was concluded that optimizing condition for the callus formation was KIN 0.1-0.5 ppm and 2,4-D 0.1-1ppm. 18 refs., 15 figs., 3 tabs.

Translated from C. R. Acad. Sci., Ser. 3 (1987) v. 304(10) p. 239-243.

The intracellular distribution of a beryllium salt in the kidneys of rats was studied by analytical ion microscopy. Beryllium has a special affinity for certain regions of the cellular nuclei where heavy concentrations appear. Examining these same nuclei under an electron microscope enables attention to be drawn to very unusual ultrastructural abnormalities in these same nuclear regions. These observations are to be seen in the light of this element's highly carcinogenic action. (author).

When specimens are observed by soft x-ray microscopy, they always absorb many photons leading to the radiation damage of them. In most cases, estimated absorbed doses are not smaller that 10^4 Gy (1 Gy = 100 rad). It is, therefore, of interest to study the probable effects of radiation on mammalian cells when they absorbed 10^4 Gy. In conclusion, (1) radiation effects on the cells irradiated with 10^4 Gy of 1.5 keV x-rays were estimated for the induction of structural changes in relation to the chromosome structure in mammalian cells; (2) time scale for the structural change may be slower than the achievable time for x-ray microscopy; (3) short pulse (less than msec) exposure is recommended for the observation of chromosome fiber in hydrated mammalian cells by x-ray microscopy (the time may depend on the size of the molecule to be observed); and (4) x-ray microscopy will be the most accessible instrument to reveal the time sequence of the radiation effect on the structural change.

51851 (LBL–27660, pp. 89-102) **Limitations to significant information in microscopy of biological macromolecules as a consequence of radiation damage.** Glaeser, R.M. (Univ. of California, Berkeley (USA)). Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

All types of currently useful short-wavelength radiation represent a flux of ionizing radiation as well as a wave-field that is suitable for diffraction and/or imaging. Obviously, then, there must ultimately be some physical limitation associated with their use for microscopy. The question is to define what the limitations should be. A self evident limitation will occur if the exposure which one uses to record an image is above a certain critical value (N_{cr} quanta per unit area) at which the biochemical function or even the detailed structure of the macromolecule has been destroyed. Under these conditions one might still produce some kind if an image, but the information contained in the image will no longer be significant. A second limitation enters into the story if the exposure is kept below this critical exposure. For any finite exposure there will be a precisely determined amount of statistical variation in the number of quanta per picture element. This shot noise becomes more and more sever as the pixel size decreases, i.e. as the resolution increases. Thus, very small features and/or very low contrast features can no longer be reliably detected, if images are taken with exposures less than the critical dose, and if that critical dose is too low.

51852 (LBL–27660, pp. 108-113) **DNA base pair sequencer: Scanning tunneling microscope plus infrared radiation.** Dawson, J. (Univ. of California, Los Angeles (USA)); Sessler, A. Lawrence Berkeley Lab., CA (USA). Aug 1989. (CONF-8905192–: Conference on X-ray microimaging for the life sciences, Berkeley, CA (USA), 24-26 May 1989). In *X-ray microimaging for the life sciences.* 206p. Order Number DE90002613. Source: NTIS, PC A10/MF A01.

There is a large amount of effort going into the sequencing of the base pairs on the human genome. We propose that a combination of Scanning Tunneling Microscopy (STM) and Infrared Excitation (IRE) of the different base pairs may be able to do the sequencing. Such a method could be rapid, accurate, and nondestructive to the molecule. The scanning tunneling microscope has the required resolution while an infrared laser provides selective excitation of each of the four base pairs. The combination provides identification of a particular base. If this proves to be a feasible sequencing method it would be much cheaper, easier, and faster. The STM moves at a rate of (about) 1000 Å/sec and hence one instrument can sequence at a rate of 30 base pairs per second. The method proposed has application far beyond DNA sequencing and thus should prove useful, if established, in many different fields of science. The radiation need not be in the infrared; energy can be transferred from electronic excitation into vibrational modes or if electronic excitations remain localized sufficiently well they might produce image discrimination.

51853 (NUREG–1396) **Environmental assessment of the thermal neutron activation explosive detection system for concourse use at US airports.** Jones, C.G. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Industrial and Medical Nuclear Safety. Aug 1990. 152p. Sponsored by Nuclear Regulatory Commission. Source: NTIS, PC A08/MF A01 - GPO; OSTI; INIS.

This document is an environmental assessment of a system designed to detect the presence of explosives in checked airline baggage or cargo. The system is meant to be installed at the concourse or lobby ticketing areas of US commercial airports and uses a sealed radioactive source of californium-252 to irradiate baggage items. The major impact of the use of this system arises from direct exposure of the public to scattered or leakage radiation from the source and to induced radioactivity in baggage items. Under normal operation and the most likely accident scenarios, the environmental impacts that would be created by the proposed licensing action would not be significant. 44 refs., 19 figs., 18 tabs.

51854 (PB–90-262114/XAB) **Transuranium elements. Volume 1. Elements of radiation protection.** Burley, G. Office of Radiation Programs, Washington, DC (USA). Jun 1990. 169p. (EPA–520/1-90/015). Source: NTIS, PC A08/MF A01.

See also Volume 2, PB–90-262122.

The report consists of two volumes and addresses the problem of environmental contamination by plutonium and other transuranium elements. Volume 1 presents an overview of selected information on the chemical and physical properties of the transuranium elements, the biological effects and risks of exposure, the major environmental transport mechanisms, and the contamination in the environs of a number of sites in the United States.

51855 (PNL–7277) **Performance testing of extremity dosimeters against a draft standard.** Harty, R.; Reece, W.D.; Hooker, C.D.; McDonald, J.C. Pacific Northwest Lab., Richland, WA (USA). Sep 1990. 60p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. Order Number DE91000052. Source: NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The assurance of worker radiation safety is directly related to the performance of personnel dosimetry. The US Department of Energy (DOE) has long recognized this critical relationship and has addressed this issue by instituting the DOE Laboratory Accreditation Program (DOELAP) which strives to improve the quality of personnel dosimetry through performance testing, dosimetry calibration, intercomparisons, evaluations and accreditations. One area of personnel dosimetry that has not been specifically addressed by DOELAP is extremity dosimeter testing. This task was directed at assessing the problems of implementing extremity dosimeter performance testing. A series of performance tests were made based on a draft standard written by the Health Physics Society Standards Committee (HPSSC) using extremity dosimeters currently in use at DOE and DOE contractor facilities. The results of this study indicate the need to incorporate performance testing of extremity dosimetry systems into DOELAP. Based on the results of this study, recommendations are made for improvements to the draft standard. 20 refs., 6 figs., 3 tabs.

51856 (PNL–7439) **A study of detailed dosimetry records for a selected group of workers included in the Hanford mortality study.** Gilbert, E.S. Pacific Northwest Lab., Richland, WA (USA). Sep 1990. 44p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. Order Number DE91000064. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Detailed dosimetry data from microfiche and microfilm in source records for the years 1944–1978 for 139 Hanford workers were examined. Information on these records was compared with computerized dose equivalent estimates used in mortality analyses. Because of difficulties in reading some early source records, and because of variation in the format of records and in algorithms for calculating whole body dose, this validation was difficult. However, apparent discrepancies in cumulative dose were less than 0.1 rem for 88% of the workers in this study, never exceeded 1.5 rem, and would be unlikely to distort conclusions of dose-response analyses. Most discrepancies occurred in early years of Hanford operations, especially 1944–46, with very few problems with dose estimates from the 1960's and 1970's. The study also provided data dosimetry practices, by calendar year, on frequency of monitoring, the number and proportion of dosimeters yielding positive results, and the magnitude of doses recorded for individual dosimeters. 7 refs., 5 figs., 13 tabs.

51857 (RERF-TR–10-87) **Search for mutations altering protein charge and/or function in children of atomic bomb survivors: final report.** Neel, J.V.; Satoh, Chiyoko; Goriki, Kazuaki; Asakawa, Jun-ichi; Fujita, Mikio; Takahashi, Norio; Kageoka, Takeshi; Hazama, Ryuji. Radiation Effects Research Foundation, Hiroshima (Japan). Apr 1990. 22p. Order Number DE91712967. Source: NTIS (US Sales Only), PC A03/MF A01.

A sample of children whose parents were proximally exposed at the time of the atomic bombings of Hiroshima and Nagasaki (i.e., within 2,000 m of the hypocenter) and a suitable comparison group have been examined for the occurrence of mutations altering the electrophoretic mobility or activity of a series of 30 proteins. The examination of the equivalent of 667,404 locus products in the children of proximally exposed persons yielded three mutations altering electrophoretic mobility; the corresponding figure for the comparison group was three mutations in 466,881 tests. The examination of a subset of 60,529 locus products for loss of enzyme activity in the children of proximally exposed persons yielded one mutation; no mutations were encountered in 61,741 determinations on the children of the comparison group. Combining these two series, the mutation rate observed in the children of proximally exposed is thus 0.60×10^{-5}/locus/generation, with 95% confidence intervals between 0.2 and 1.5×10^{-5}, and in the comparison children, 0.64×10^{-5}/locus/generation, with 95% intervals between 0.1 and 1.9×10^{-5}. The average conjoint gonad doses of the proximally exposed parents are estimated to be 0.437 Gy of gamma radiation and 0.002 Gy of neutron radiation. Assigning a relative biological effectiveness of 20 to the neutron radiation, the combined total gonad dose of the parents becomes 0.477 Sv. (author).

51858 (RERF-TR–22-89) **Spontaneous loss and alteration of antigen receptor expression in mature CD4+ T cells.** Kyoizumi, Seishi; Akiyama, Mitoshi; Hirai, Yuko; Kusunoki; Yoichiro; Tanabe, Kazumi; Umeki, Shigeko; Nakamura, Nori; Yamakido, Michio; Hamamoto, Kazuko. Radiation Effects Research Foundation, Hiroshima (Japan). Apr 1990. 25p. Order Number DE91712966. Source: NTIS (US Sales Only), PC A03/MF A01.

The T-cell receptor CD3 (TCR/CD3) complex plays a central role in antigen recognition and activation of mature T cells, and therefore abnormalities in the expression of the complex should induce unresponsiveness of T cells to antigen stimulus. Using flow cytometry, we detected and enumerated variant cells with loss or alteration of surface TCR/CD3 expression among human mature CD4+ T cells. The presence of variant CD4+ T cells was demonstrated by isolating and cloning them from peripheral blood, and their abnormalities can be accounted for by alterations in TCR expression such as defects of protein expression and partial protein deletion. The variant frequency in peripheral blood increased with aging in normal donors and was highly elevated in patients with ataxia telangiectasia, an autosomal recessive inherited disease with defective DNA repair and variable T-cell immunodeficiency. These findings suggest that such alterations in TCR expression are induced by somatic mutagenesis of TCR genes and can be important factors related to age-dependent and genetic disease-associated T-cell dysfunction. (author).

51859 Poisson regression analysis of the mortality among a cohort of World War II nuclear industry workers. Frome, E.L. (Oak Ridge National Laboratory, TN (USA)); Cragle, D.L.; McLain, R.W. *Radiation Research (USA)*, 123(2): 138-152 (Aug 1990).

A historical cohort mortality study was conducted among 28,008 white male employees who had worked for at least 1 month in Oak Ridge, Tennessee, during World War II. The workers were employed at two plants that were producing enriched uranium and a research and development laboratory. Vital status was ascertained through 1980 for 98.1% of the cohort members and death certificates were obtained for 96.8% of the 11,671 decedents. A modified version of the traditional standardized mortality ratio (SMR) analysis was used to compare the cause-specific mortality experience of the World War II workers with the U.S. white male population. An SMR and a trend statistic were computed for each cause-of-death category for the 30-year interval from 1950 to 1980. The SMR for all causes was 1.11, and there was a significant upward trend of 0.74% per year. The excess mortality was primarily due to lung cancer and diseases of the respiratory system. Poisson regression methods were used to evaluate the influence of duration of employment, facility of employment, socioeconomic status, birth year, period of follow-up, and radiation exposure on cause-specific mortality. Maximum likelihood estimates of the parameters in a main-effects model were obtained to describe the joint effects of these six factors on cause-specific mortality of the World War II workers. We show that these multivariate regression techniques provide a useful extension of conventional SMR analysis and illustrate their effective use in a large occupational cohort study.

51860 3-Aminobenzamide, an inhibitor of poly(ADP-ribose) polymerase, is a stimulator, not an inhibitor, of DNA repair. Cleaver, J.E. (Univ. of California, San Francisco (USA)); Morgan,

W.F. *Experimental Cell Research (USA)*, 172(2): 258-264 (Oct 1987).

An inhibitor of poly(ADP-ribose) synthesis, 3-aminobenzamide (3AB), at low concentrations was found to reduce strand-break frequencies and increase repair replication in human lymphoid cells damaged by methyl methanoesulfonate. A concentration of 0.1 mM 3AB was adequate to produce a maximum effect on strand-break frequencies and repair replication. This evidence, together with previous measurements, demonstrates that 3AB cannot be regarded as an inhibitor of DNA repair; rather, it actually accelerates the ligation of DNA repair patches. Previous considerations of 3AB as a repair inhibitor may have derived from the use of excessive concentrations above 1 mM that may have stimulated additional damage and from the use of ethyl alcohol as a solvent for 3AB. Interpretations of the role of single-strand breaks and poly(ADP-ribose) in DNA repair, differentiation, and gene activity may need reevaluation because they have frequently been based on an erroneous notion of 3AB as a repair inhibitor, when its mode of action is, in fact, more complex.

51861 **Differential effect of ionizing radiation on transcription in repair-deficient and repair-proficient mice.** Munson, G.P. (Argonne National Laboratory, IL (USA)); Woloschak, G.E. *Cancer Research (USA)*, 50(16): 5045-5048 (15 Aug 1990).

Experiments were designed to examine in vivo changes in total transcription and in the expression of the c-fos gene following whole-body exposure of mice to JANUS fission-spectrum neutrons. Radiation repair-deficient (wst/wst) and -proficient (wst/., C57BL/6 x C3H F1) mice were exposed to JANUS fission-spectrum neutrons calibrated to deliver a gut dose of 50 cGy. Animals were sacrificed less than 10 or at 60 min postirradiation, and gut tissues were removed for study. Our results revealed that, in repair-proficient mice, an immediate depression (relative to untreated control) in total transcription was evident that continued through 1 h postirradiation. Conversely, radiation-sensitive wst/wst mice displayed doubled transcription levels postirradiation. Expression of c-fos was consistently depressed following radiation exposure in control and wst/wst mice. However, the depression of c-fos mRNA was delayed in wst/wst mice relative to controls. These results demonstrate abnormal regulation of transcription and of c-fos mRNA accumulation in repair-deficient wasted mice following exposure to ionizing radiation. In addition, this work documents rapid total transcriptional depression in normal mice following radiation exposure.

51862 (AD-A-223526/5/XAB) **Determination of the repeated oral toxicity of halocarbon oil, series 27-S.** Kinkead, E.R.; Culpepper, B.T.; Henry, S.S.; Szotak, P.S.; Flemming, C.D. Naval Medical Research Inst., Bethesda, MD (USA). 1990. 17p. (NMRI-90-44). Source: NTIS, PC A03/MF A01.

Pub. Toxicology and Industrial Health, Vol. 6, No. 1, 17-32(1990).

Halocarbon 27-S (HC 27-S), a polymer of chlorotrifluoroethylene (CTFE), is used as a lubricating oil for pumps in hyperbaric chambers. Although monomeric CTFE has been shown to produce renal lesions in rats, the toxicity of CTFE polymers have been investigated. To assess the toxicity of repeated exposure to HC 27-S, three groups of male and female Fischer-344 rats were dosed. Decreased water consumption and urine output were apparent in all test groups. Statistically significant increases in fluoride excretion were noted in 24-hr urine samples assessed periodically during the study. Neurotoxic signs were observed in female rats but not in male rats. Significant increases in liver and kidney weights were seen in all rats, regardless of number of dosing days. The increased fluoride burden in treated animals appeared sufficient to alter bone calcium/phosphate ratios in male rats but not female rats. Gross liver enlargement and hepatocellular cytomegaly indicated that the liver was probably the primary target organ following repeated administration of HC 27-S.

51863 (AD-A-223537/2/XAB) **2,3,7,8-tetrachlorodibenzo-p-dioxin pretreatment of female mice altered tissue distribution but not hepatic metabolism of a subsequent dose.** Curtis, L.R.; Kerkvliet, N.I.; Baecher-Steppan, L.; Carpenter, H.M. Oregon State Univ., Corvallis, OR (USA). Dept. of Fisheries and Wildlife. 1990. 10p. Grant AFOSR-87-0185. Source: NTIS, PC A02/MF A01.

Pub. in Fundamental and Applied Toxicology, Vol. 14, 523-531(1990).

Concern over environmental contamination with 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) stimulated research of its toxic actions and underlying molecular events. Various epithelia, epithelial-derived tissues such as liver, and the immune system were identified as major target tissues. A toxic mechanism based upon interaction of TCDD with the Ah receptor and subsequent expression of a pleiotropic response provided an explanation for many reported phenomena. In light of the tissue and subcellular specificity of TCDD action, tissue distribution of a given dose likely has substantial effects on patterns of tissue damage. Further, chronic toxicity of repeated low doses may be influenced by factors which increase or decrease TCDD concentrations to which particular cell types are exposed.

51864 (KFK-PEF-57) **Local sensitization to inhalation antigens of bronchi previously damaged by inhalation of irritant gases (SO_2, NO_2, O_3 and tobacco smoke).** Riedel, F. (Marburg Univ. (Germany, F.R.). Zentrum fuer Kinderheilkunde); Rieger, C.H.L. Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Projekt Europaeisches Forschungszentrum fuer Massnahmen zur Luftreinhaltung (PEF). Jan 1990. 185p. (In German). Contract PEF 86/003/1C. Order Number DE91706018. Source: NTIS (US Sales Only), PC A09/MF A01.

The available evidence from epidemiologic studies and animal experiments suggests that there is a link between air pollution and the occurrence of diseases of allergic origin. The findings revealed on the basis of the animal model used here clearly pointed to the fact that exposure to pollutants and sensitive reactions to inhaled allergens are related in a causative way. For the purposes of this study, guinea-pigs were exposed to different concentrations of SO_2, NO_2, ozone and tobacco smoke before being challenged with ovalbumin, which was used as a sensitising inhalation allergen. After a recovery period, specific bronchial challenges, specific antibody determinations in the serum and bronchoalveolar lavage were employed to assess the degree of sensitisation to the inhaled allergen, which was then contrasted with that observed in control animals without previous lesions. It was found for all the pollutants examined here that the extent of sensitisation to the inhaled allergen decreased in proportion to the concentration of the toxins and the duration of exposure. (orig./MG).

51865 (OE/ARB-90-04213) **A survey to document the decline status of the sugar maple forest of Ontario, 1986.** McIlveen, W.D. (Ontario Ministry of the Environment, Toronto, ON (Canada)); McLaughlin, D.L.; Arnup, R.W. Ontario Ministry of the Environment, Toronto, ON (Canada). Air Resources Branch. Dec 1989. 80p. (MICROLOG-90-04213). Source: PC Ontario Ministry of the Environment, Public Information Office, 135 St. Clair Ave. West, Toronto, ON, CAN M4V 1P5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC N/C; MF $10 CAN.

Air pollutants are alleged to contribute to regional forest decline. The severity and extent of decline has become more apparent, particulary in the last 10 to 15 years. In 1985, a survey was initiated to examine the decline conditions of Ontario's hardwood forest. Sugar maple was the primary target species, and determination of causal factors was not an objective, although some causal factors are discussed. In total, 110 plots were established and the initial evaluation of 11,000 trees was completed in 1986, using a numerical Decline Index rating system. Additional data regarding gross soil characteristics, stand sizes, disease and insect activity, and the frequency of tree stem defects were also collected. Hardwood forest decline was scattered in isolated areas of Ontario although regional patterns were evident. Generally, trees in the north tended to be in somewhat poorer condition than southern trees, although the southwestern area of the province also had a higher frequency of declining trees. Factors which may influence those results include the high sensitivity of northern soils to acidification by atmospheric pollutants and the high levels of air pollutant

deposition in the southwest. The survey plots in central Ontario consistently contained trees in good condition with a low frequency of decline. Two separate statistical analysis methods were used to confirm the regional decline pattern. Ranked in order of decline severity, the tree species which comprised greater than 1% of the sample population are: sugar maple < beech < white ash < basswood < yellow birch = red oak < red maple < ironwood < white birch < black cherry. 11 figs., 17 tabs.

51866 (ORNL/FTR-3768) **[Quantitative structure-activity relationships in environmental toxicology]: Foreign trip report, September 14, 1990-September 21, 1990.** Turner, J.E. Oak Ridge National Lab., TN (USA). 4 Oct 1990. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE91000874. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler attended the Fourth International Workshop on QSAR (Quantitative Structure-Activity Relationships) in Environmental Toxicology. He was an author or co-author on one platform and two poster presentations. The subject of the workshop offers a framework for analyzing and predicting the fate of chemical pollutants in organisms and the environment. QSAR is highly relevant to the ORNL program on the physicochemical characterization of chemical pollutants for health protection.

51867 (PB-90-247628/XAB) **Toxicological Profile for Tetrachloroethylene. Final report.** Syracuse Research Corp., NY (USA). Jan 1990. 119p. Contract EPA-68-C8-0004. Source: NTIS, PC A06/MF A01.

The ATSDR Toxicological Profile for Tetrachloroethylene is intended to characterize succinctly the toxicological and health effects information for the substance. It identifies and reviews the key literature that describes the substance's toxicological properties. Other literature is presented but described in less detail. The profile is not intended to be an exhaustive document; however, more comprehensive sources of specialty information are referenced. The profile begins with a public health statement which describes in nontechnical language the substance's relevant toxicological properties. Following the statement is material that presents levels of significant human exposure and, where known, significant health effects. The adequacy of information to determine the substance's health effects is described. Research gaps in nontoxic and health effects information are described. Research gaps that are of significance to the protection of public health will be identified in a separate effort. The focus of the document is on health and toxicological information.

51868 (PB-90-256512/XAB) **Educating the public about the Health and Welfare Risks Associated with ground-level ozone. Technical report.** Boyer, M.A. Yale Univ., New Haven, CT (USA). School of Forestry and Environmental Studies. 1989. 79p. Source: NTIS, PC A05/MF A01.

The report is part of the National Network for Environmental Management Studies under the auspices of the Office of Cooperative Environmental Management of the U.S. Environmental Protection Agency. The NNEMS research project recommends ways to increase media coverage of the poisonous ozone problem. Current media fails to discriminate between good ozone (stratospheric) and poisonous ozone (tropospheric) creating public confusion. Initial recommendation encourages the Agency to add an adjective to the word ozone to communicate a clear, powerful message vividly depicting the harmful distinction. EPA's poisonous ozone communications campaign hinges largely on its ability to capitalize on free media resources and educational institutions. A media kit developed for press members will facilitate television, radio and newspaper coverage of the summer ozone problem. The kits can be distributed at an EPA news conference directed at the poisonous ozone problem.

51869 (PB-90-262072/XAB) **Effects of acid fog on airway function in people with asthma. Final report.** Sheppard, D.; Balmes, J.R.; Christian, D. California Univ., San Francisco, CA (USA). Lung Biology Center. 30 Nov 1988. 206p. Contract ARB-A5-179-33. Source: NTIS, PC A10/MF A02.

The study was built on earlier work examining the effects of acidic fog on human subjects with asthma. Mouthpiece exposure studies on asthmatic subjects showed that both nitric and sulfuric acids potentiate the bronchoconstrictor effects of fog water, and that these acids appear to be similar in this respect. The work resulted in the exposure chamber at the University of California, San Francisco being extensively modified, based on improvements recommended in an earlier investigation, thus allowing human subjects to be exposed to rigorously controlled and monitored test fogs. The study used the chamber to first examine the effects of fog without acid, and then the effects of fog with acid, on exercising subjects with asthma.

51870 (PNL-7432) **Analysis of health impact inputs to the US Department of Energy's risk information system.** Droppo, J.G. Jr.; Buck, J.W.; Strenge, D.L.; Siegel, M.R. Pacific Northwest Lab., Richland, WA (USA). Aug 1990. 86p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE91000174. Source: NTIS, PC A05/MF A01; OSTI; INIS; GPO Dep.

The US Department of Energy (DOE) is in the process of completing a survey of environmental problems, referred to as the Environmental Survey, at their facilities across the country. The DOE Risk Information System (RIS) is being used to prioritize these environmental problems identified in the Environmental Survey's findings. This report contains a discussion of site-specific public health risk parameters and the rationale for their inclusion in the RIS. These parameters are based on computed potential impacts obtained with the Multimedia Environmental Pollutant Assessment System (MEPAS). MEPAS is a computer-based methodology for evaluating the potential exposures resulting from multimedia environmental transport of hazardous materials. This report has three related objectives: document the role of MEPAS in the RIS framework, report the results of the analysis of alternative risk parameters that led to the current RIS risk parameters, and describe analysis of uncertainties in the risk-related parameters. 20 refs., 17 figs., 10 tabs.

51871 (QME-PA-34) **Effects of acidity on the fish populations of the north Mauricie.** Tremblay, S. Quebec Ministere de l'Environnement, Ste-Foy, PQ (Canada). Jul 1989. 94p. (MICROLOG-90-02961). Source: PC Quebec Ministere de l'environnement, 3900, rue Marly, Ste Foy, PQ, CAN G1X 4E4; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. Prices: PC N/C; MF $10 CAN.

Since summer 1987, sampling has been carried out on the fish populations of 30 lakes in the northern part of the Mauricie hydrographic region in Quebec in order to evaluate the impact of lake acidity on fish. Analysis of the results of experimental fishing shows that fish diversity is not influenced directly by environmental acidity. Nevertheless, it seems that a pH of 5.3-5.5 is the lower limit of the resistance to acidity of the majority of the fish species. Perca flavescens and Esox lucius are the most resistant species, as well as most of the cyprinids. Salmonids, as well as Lotta lotta and Cottus bairdi, are the most sensitive to lake acidity. In addition, the increase in acidity brings with it a reduction in the density of Semotilus margarita and Salvelinus fontinalis in the lakes with communities of Catostomus commersoni. For the fish predator community, no species seems directly affected by the increase in acidity. In any event, the aluminum concentration seems to have had more important adverse effects on the fish fauna of the two communities. The decrease in density of Semotilus margarita and Stizostedion vitreum is related to the increase in aluminum concentration in the environment. As well, the biomass and average weight of Semotilus corporalis is equally affected by aluminum. The analysis of the size distributions of P. flavescens, S. vitreum and S. fontinalis populations living in acid waters reveals the absence of numerous size categories which, nevertheless, are present in lakes of transitional acidity (pH 5.5-6) and non-acid lakes. 90 refs., 46 figs., 5 tabs.

51872 **Lichens as air pollution biomonitors in a semiarid environment in Idaho.** Rope, S.K. (Dept. of Energy, Idaho Falls, ID (USA)); Pearson, L.C. *Bryologist (USA)*, 93(1): 50-61 (Spr 1990).

Two measurement techniques were employed to evaluate the feasibility of using lichens as in situ biomonitors of atmospheric pollution in a semiarid climate - trace element analysis and electrolyte leakage from cells. Trace element concentrations were generally higher in Lecanora melanophthalma (ram.) Ram. tissues

than previously measured in sagebrush (Artemisia tridentata) and perennial grasses from the same locations, but lower than in soil. Lichens from an urban area (Idaho Falls) had statistically higher concentrations of ten elements, particularly lead and zinc, than those from the Idaho National Engineering Laboratory (INEL) and Craters of the Moon National Monument. Levels of fluoride, nickel, and seven other elements were high at the INEL relative to the other sites. Thalli collected downwind from the Idaho Chemical Processing Plant (ICPP) at the INEL were significantly higher in boron and lead content than those collected at crosswind locations: levels of eleven elements were significantly higher in lichens collected at 5 or 10 km from the ICPP than in those collected at 2 km. Electrolyte leakage was greatest from thalli collected in the nighttime downwind direction from the ICPP, even though daytime winds, which blow in the opposite direction, are more frequent, suggesting that in a semiarid climate, injury from atmospheric SO_2 and NO_x pollution in lichen tissues is greatest when the thalli are moist from morning dew or other sources. These results demonstrate that some lichen species, especially Lecanora melanophthalma, have potential for biomonitoring of atmospheric pollutants in the semiarid regions of the Intermountain West.

51873 **Response of rat tracheal epithelium to ozone and oxygen exposure in vitro.** Nikula, K.J. (Inhalation Toxicology Research Institute, Albuquerque, NM (USA)); Wilson, D.W. *Fundamental and Applied Toxicology (USA),* 15(1): 121-131 (Jul 1990).

Although ozone-induced epithelial injury in vivo has been morphologically characterized, effects of gaseous oxidants on respiratory epithelium in organ culture, where tissue organization is maintained but systemic influences are eliminated, have not been thoroughly investigated. In this study, we exposed tracheal organ cultures from rats to 95% oxygen and 1 ppm ozone, alone and in combination, to determine (1) whether epithelial responses to ozone similar to those observed in vivo occur in airways separated from systemic physiologic, secretory, and inflammatory reactions; (2) whether concentrations of oxygen sufficient to potentially cause oxidant injury result in morphologic epithelial alterations similar to those that occur in ozone toxicity; and (3) if the combined oxidant insult of oxygen and ozone results in more severe damage to the tracheal epithelium than occurs with ozone in air. Tracheal organ cultures were exposed to filtered air and 5% carbon dioxide; filtered air, 5% carbon dioxide, and 1 ppm ozone; 95% oxygen and 5% carbon dioxide; or 95% oxygen, 5% carbon dioxide, and 1 ppm ozone for 96 hr. Light- and quantitative electron-microscopic evaluation showed that epithelia exposed to 1 ppm ozone in air exhibited loss of ciliated cells and ciliated cell damage. The epithelia exposed to 95% oxygen and 5% carbon dioxide were pseudostratified, columnar, ciliated, and hyperplastic. Epithelia exposed to 95% oxygen plus 1 ppm ozone were stratified and nonciliated or very sparsely ciliated. The predominant cell types in epithelia exposed to oxygen plus ozone were serous cells and metaplastic cells, and focal aggregates of adherent necrotic cells were present. We conclude that there was a synergism between oxygen and ozone exposure leading to enhanced epithelial injury and metaplasia.

51874 **Concentrations of selected chlorinated pesticides in shrimp collected from the Calcasieu River/Lake Complex, Louisiana.** Murray, H.E. (McNeese State Univ., Lake Charles, LA (USA)); Beck, J.N. *Bulletin of Environmental Contamination and Toxicology (USA),* 44(5): 798-804 (May 1990).

For several decades inland and coastal aquatic ecosystems have been affected by a multitude of synthetic chemical substances. This is a consequence of population growth and increased industrial and agricultural activity. Many of these chemicals, the by-products of their production, and degradation products ultimately find their way into the aquatic environment as pollutants. The extent to which these pollutants affect the environment and its inhabitants depends largely upon the quantity and nature of the particular compounds involved. Halogenated hydrocarbons, particularly polychlorinated biphenyls (PCBs), and the pesticide DDT and its degradation products have received much attention as environmental pollutants. Because of the economic importance of the shrimping industry to southwest Louisiana, the objective of this study was to analyze shrimp collected from the Calcasieu River/Lake Complex for the presence of selected chlorinated pesticides. The presence of these compounds within shrimp tissues would serve as an indicator for the extent of pollution throughout this important estuarine system.

51875 **Optimization of surface sterilization for legume seed.** Caetano-Anolles, G. (Univ. of Tennessee, Knoxville (USA)); Favelukes, G.; Bauer, W.D. *Crop Science (USA),* 30(3): 708-712 (May-Jun 1990). DOE Contract FG02-86ER13522.

Roots of alfalfa (Medicago sativa L.), white clover (Trifolium repens L.), and soybean [Glycine max (L.) Merr.] seedlings are frequently contaminated with bacteria even after surface sterilization of the seeds and germination under aspetic conditions. Several seed-sterilization procedures were compared for their ability to minimize or eliminate such contamination without damaging the plant. Mercuric chloride proved the best seed disinfectant for alfalfa and white clover. Calcium hypochlorite was the best for soybean. For alfalfa seeds, treatment with 95% ethanol (v/v) for 60 min followed by 0.2% $HgCl_2$ (v/v) for 15 min prior to rinsing and imbibition resulted in a low frequency (< 5%) of seed and root contamination. This treatment resulted in no measurable damage to alfalfa seedlings with respect to root growth, nodulation efficiency, or rate of nodule emergence following inoculation with Rhizobium meliloti. Longer exposures to $HgCl_2$ further reduced bacterial contamination, but also caused modest reductions in seed germination. None of the surface-sterilization techniques tested completely eliminated bacterial contaminants. It appears that these sterilization-resistant contaminants are borne within the seed and proliferate on plant surfaces after germination, with possible effects on plant health.

51876 (AD-A-223360/9/XAB) **Effects of electric fields on membrane-bound Na, K-ATPase. Progress report, 1 July 1989-30 June 1990.** Tsong, T.Y. Minnesota Univ., St. Paul, MN (USA). Dept. of Biochemistry. 30 Jun 1990. 8p. Contract N00014-88-J-1220. Source: NTIS, PC A02/MF A01.

We continued to work on effects of oscillating electric fields on membrane functions, in particular the electric activation of Na, K-ATPase, and to develop theory of electro-conformational coupling. We believe transmembrane electric fields are involved in the regulation of the internal activity of a cell and also in the cell-to-cell communications. An in depth study of Na, K-ATPase will provide useful information concerning the molecular design of a cell to sense and to transmit signals.

51877 (AD-A-223397/1/XAB) **Interaction of electromagnetic fields with chondrocytes in gel culture. Final report, February-August 1989.** Grodzinsky, A.J.; Gluzband, Y.A.; Buschmann, M.D. Massachusetts Inst. of Tech., Cambridge, MA (USA). Dept. of Electrical Engineering and Computer Science. Feb 1990. 32p. Contract F33615-87-D-0626. Source: NTIS, PC A03/MF A01.

The research accomplished during this project period focused on control experiments designed to establish whether cartilage cells from normal cartilage will continue to synthesize and accumulate normal extracellular matrix in agarose gel culture. This information is essential to properly design experiments to qualify changes in chondrocyte biosynthesis due to applied electromagnetic fields. The results suggest that both normal chondrocytes and swarm rat chondrosarcoma cells in agarose culture can continue to synthesize matrix macromolecules at a rate similar to or slightly higher than that in normal cartilage; also, that chondrocytes in agarose can successfully mediate assembly and accumulation of normal, mechanically functional extracellular matrix.

51878 (MIC-90-03856/XAB) **Electric and magnetic fields and your health: A report.** Working Group on Electric and Magnetic ELF Fields, Ottawa, ON (Canada). ©1990. 34p. (SSC-H-46-2/89-150E). Source: NTIS, PC EE07/MF E01.

Text in English and French (Bilingual). French ed. on the same fiche.

There has been increased concern regarding health effects of extremely low frequency ELF (1-300 Hz) electric and magnetic fields, particularly of those produced by power lines. In response to this concern, a working group representing labour, utility companies, academia, and federal and provincial governments was

formed in 1986 to assess the existence and scope of health effects of electric and magentic fields related to the generation and use of electricity, to identify gaps in knowledge, to foster research to fill these gaps, and to educate the public on the state of scientific understanding. This document was prepared to educate the public regarding health effects of exposure to electric and magnetic fields at 60 Hz. Reports on the Working Group's activities, conclusions and recommendations are also included.

57 HEALTH AND SAFETY

51879 (DOE/EH–0141) **Tiger Team Assessment of the Sandia National Laboratories, Livermore, California.** USDOE, Washington, DC (USA). Aug 1990. 709p. Sponsored by U.S. DOE Environment Health & Safety. Order Number DE90018024. Source: NTIS, PC A99/MF A01 - OSTI; GPO Dep.

This report provides the results of the Tiger Team Assessment of the Sandia National Laboratories (SNL) in Livermore, California, conducted from April 30 to May 18, 1990. The purpose of the assessment was to provide the Secretary of Energy with the status of environment, safety and health (ES&H) activities at SNL, Livermore. The assessment was conducted by a team consisting of three subteams of federal and private sector technical specialists in the disciplines of environment, safety and health, and management. On-site activities for the assessment included document reviews, observation of site operations, and discussions and interviews with DOE personnel, site contractor personnel, and regulators. Using these sources of information and data, the Tiger Team identified a significant number of findings and concerns having to do with the environment, safety and health, and management, as well as concerns regarding noncompliance with Occupational Safety and Health Administration (OSHA) standards. Although the Tiger Team concluded that none of the findings or concerns necessitated immediate cessation of any operations at SNL, Livermore, it does believe that a sizable number of them require prompt management attention. A special area of concern identified for the near-term health and safety of on-site personnel pertained to the on-site Trudell Auto Repair Shop site. Several significant OSHA concerns and environmental findings relating to this site prompted the Tiger Team Leader to immediately advise SNL, Livermore and AL management of the situation. A case study was prepared by the Team, because the root causes of the problems associated with this site were believed to reflect the overall root causes for the areas of ES&H noncompliance at SNL, Livermore. 4 figs., 3 tabs.

Basic documment to the report 'An environmentally adapted energy system', STEV–1990-2.

The aim of this report is to elucidate risks in the working environment and industrial injuries caused during different phases and processing steps in connection with power production. Part 2 of the report describes the conditions for wind power plants and solar power plants. For wind power the important differences between land- and sea-based sitings is observed. For solar power, the climate in Sweden excludes everything but photovoltaic power. Part 3 concerns nuclear power, from the uranium milling to the final storage of radioactive wastes. Part 4 give details for coal-, oil- and chipburning facilities as well as for power plants fuelled with peat and natural gas. For all of the alternatives, statistical data is presented covering fatal injuries, total number of injuries, and lost work days. (U.W.).

51882 (AD-A–223574/5/XAB) **Liquefaction mitigation technology. Final report, February 1988–June 1989.** Millea, M.T. Naval Civil Engineering Lab., Port Hueneme, CA (USA). Feb 1990. 37p. (NCEL-TN–1808). Source: NTIS, PC A03/MF A01.

Seismically-induced soil liquefaction is a great threat to the Navy's huge shore facility investment located at the waterfront. Improvement of potentially liquefiable soil beneath and surrounding structures is currently feasible. Using empirical design methods, the construction of stone columns on relatively close centers provides increased resistance to lateral loading from earthquake waves and increases vertical drainage by reducing the radial flow path, which can increase the rate of dissipation of pore water pressure. A background investigation of state-of-the-art soil improvement methods was conducted. The Princeton Effective Stress Soil Model was evaluated as a tool to aid the design of soil improvement methods. Finite element models with and without stone columns were subjected to simulated earthquake excitation using DYNAFLOW, a finite element computer model developed at Princeton University to analyze dynamic soil-structure interaction problems. Results indicate that the stone columns improved site conditions and decreased damage due to vibratory motion. The results also indicated that each potentially liquefiable site is unique and will require individual analysis.

51883 (INP–1397/AP) **SLOWN2.BAS program for calculation of the rock neutron slowing down parameters.** Czubek, J.A. Institute of Nuclear Physics, Cracow (Poland). 1988. 53p. Order Number DE91604878. Source: NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

BASIC/IBM PC.

The most important parameter needed in numerous methods of neutron calculations in nuclear geophysics is the slowing down length value for a given rock. The SLOWN2.BAS program written in BASIC for the IBM PC was written for this purpose. The model of the rock taken for calculation is a rock matrix which can contain such elements as H, B, C, N, O, F, Na, Mg, Al, Si, Cl, K, Ca, Ti, Cr, Mn, Fe, Ni, Pb. The pore space of the rock can be filled with brine of a given salinity (in ppm of NaCl) and with hydrocarbons of the form $n.CH_x$. The calculation can be performed for different neutron sources: Ra-Be, Po-Be, Am-Be, Cf-252, 14 MeV, 10.5 MeV, 6.5 MeV, 4.0 MeV, 2.5 MeV, 1.4 MeV, 0.8 MeV, 0.4 MeV, 0.2 MeV and 0.1 MeV using the 26 neutron group cross section library introduced by another program called NEWCROSS.BAS. Further parameters calculated by the SLOWN2.BAS program are: the effective diffusion coefficient for the neutron slowing down process, the neutron slowing down time, the probability of the neutron escaping absorption during the slowing down process and the space integrated spectrum of the neutron flux as a function of the neutron lethargy. All results can be stored on a disk and retrieved afterwards using an auxiliary program REPRO2.BAS also included in this report. (author).

51884 (IS-IPRT–7) **Iowa State Mining and Mineral Resources Research Institute: Final report, July 1, 1989–June 30, 1990.** Iowa State Univ. of Science and Technology, Ames, IA (USA). Iowa State Mining and Mineral Resources Research Inst. Aug 1990. 134p. Sponsored by U.S. Department of the Interior. DOE Contract W-7405-ENG-82. Order Number DE91000572. Source: NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This final report describes the activities of the Iowa State Mining and Mineral Resources Research Institute (ISMMRRI) at Iowa State University for the period July 1, 1989, to June 30, 1990. Activities include research in mining- and mineral-related areas, education and training of scientists and engineers in these fields,

administration of the Institute, and cooperative interactions with industry, government agencies, and other research centers. During this period, ISMMRRI has supported research efforts to: (1) Investigate methods of leaching zinc from sphalerite-containing ores. (2) Study the geochemistry and geology of an Archean gold deposit and of a gold-telluride deposit. (3) Enchance how-quality aggregates for use in construction. (4) Pre-clean coal by triboelectric charging in a fluidized-bed. (5) Characterize the crystal/grain alignment during processing of yttrium-barium-copper-perovskite (1-2-3) superconductors. (5) Study the fluid inclusion properties of a fluorite district. (6) Study the impacts of surface mining on community planning. (7) Assess the hydrophobicity of coal and pyrite for beneficiation. (8) Investigate the use of photoacoustic absorption spectroscopy for monitoring unburnt carbon in the exhaust gas from coal-fired boilers. The education and training program continued within the interdepartmental graduate minor in mineral resources includes courses in such areas as mining methods, mineral processing, industrial minerals, extractive metallurgy, coal science and technology, and reclamation of mined land. In addition, ISMMRRI hosted the 3rd International Conference on Processing and Utilization of High-Sulfur Coals in Ames, Iowa. The Institute continues to interact with industry in order to foster increased cooperation between academia and the mining and mineral community.

51885 (KY/H–111) **Seismic issues at the Paducah Gaseous Diffusion Plant.** Fricke, K.E. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA)). Paducah Gaseous Diffusion Plant, KY (USA). Nov 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OU21400. (CONF-8903247–1: Seismic expert workshop, Puducah, KY (USA), 13-15 Mar 1989). Order Number DE91000573. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A seismic expert workshop was held at the Paducah Gaseous Diffusion Plant (PGDP) on March 13–15, 1989. the PGDP is operated by Martin Marietta Energy Systems, Inc. for the United States Department of Energy (DOE). During the last twenty years the design criteria for natural phenomenon hazards has steadily become more demanding at all of the DOE Oak Ridge Operations (ORO) sites. The purpose of the two-day workshop was to review the seismic vulnerability issues of the PGDP facilities. Participants to the workshop included recognized experts in the fields of seismic engineering, seismology and geosciences, and probabilistic analysis, along with engineers and other personnel from Energy Systems. A complete list of the workshop participants is included in the front of this report. 29 refs.

51886 (LBL–29257) **Acoustic emission in a fluid saturated heterogeneous porous layer with application to hydraulic fracture.** Nelson, J.T. (California Univ., Berkeley, CA (USA). Dept. of Mechanical Engineering). Lawrence Berkeley Lab., CA (USA). Nov 1988. 272p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE91000223. Source: NTIS, PC A13/MF A01 - OSTI; GPO Dep.

A theoretical model for acoustic emission in a vertically heterogeneous porous layer bounded by semi-infinite solid regions is developed using linearized equations of motion for a fluid/solid mixture and a reflectivity method. Green's functions are derived for both point loads and moments. Numerically integrated propagators represent solutions for intermediate heterogeneous layers in the porous region. These are substituted into a global matrix for solution by Gaussian elimination and back-substitution. Fluid partial stress and seismic responses to dislocations associated with fracturing of a layer of rock with a hydraulically conductive fracture network are computed with the model. A constitutive model is developed for representing the fractured rock layer as a porous material, using commonly accepted relationships for moduli. Derivations of density, tortuosity, and sinuosity are provided. The main results of the model application are the prediction of a substantial fluid partial stress response related to a second mode wave for the porous material. The response is observable for relatively large distances, on the order of several tens of meters. The visco-dynamic transition frequency associated with parabolic versus planar fluid velocity distributions across micro-crack apertures is in the low audio or seismic range, in contrast to materials with small pore size, such as porous rocks, for which the transition frequency is ultrasonic. Seismic responses are predicted for receiver locations both in the layer and in the outlying solid regions. In the porous region, the seismic response includes both shear and dilatational wave arrivals and a second-mode arrival. The second-mode arrival is not observable outside of the layer because of its low velocity relative to the dilatational and shear wave propagation velocities of the solid region.

51887 (MIC–90-04256/XAB) **Radiocarbon dates from the western basin of the Champlain Sea. Paper No. 89-22.** Richard, S.H. Geological Survey of Canada, Ottawa, ON (Canada). ©1989. 23p. (SSC-M–44-89/22E). Source: NTIS, PC EE07/MF E01.

S.H. Richard spent much of his career mapping and conducting Quaternary research in the Ontario-Quebec region near Ottawa. His work in the Ottawa area was conducted from 1970-87 and one of his main goals was to develop a radiocarbon chronology for the Champlain Sea. This report assembles all of these dates as an inventory and also contains a brief summary of the interpretations that Richard placed on these ages.

51888 (NUREG/CR–5258-Vol.3) **Georgia/Alabama regional seismographic network: Volume 3, Annual report, July 1987–June 1988.** Long, L.T. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Georgia Inst. of Tech., Atlanta, GA (USA). School of Earth and Atmospheric Sciences. Sep 1990. 101p. Sponsored by Nuclear Regulatory Commission. Source: NTIS, PC A06/MF A01 - GPO - OSTI.

A review of the historical seismicity of southeastern Tennessee suggests that the period of 1970 through 1988 was anomalously more active then before 1970. If this is true, then is represents a unique stress release event that would satisfy the model for major intraplate earthquakes proposed by Long (1988). First motion data and SV/P amplitude ratios were used to determine 36 single events and two composite focal mechanism solutions for earthquakes in southeastern Tennessee. The dominant focal mechanism is strike slip with reverse or normal fault components. Linearizing the relation between measured apparent coda Q and assumed constant coda Q for discrete zones of crust suggests an anomalously low (Q = 50) region northeast of station CBT. Fracture density was mapped in an area of induced seismicity near Clarks Hill Reservoir. It appears that areas of higher joint spacing correspond to zones of induced seismicity. In this and other reservoirs, earthquakes tend to occur in granite gneiss where jointing is sparse and the rock is strong. Seismic activity is not often observed in foliated schists and altered mafic rocks, in which stress may be released through creep.

51889 (USGS-OFR–90-87) **Compilation of modal analyses of volcanic rocks from the Nevada Test Site area, Nye County, Nevada.** Page, W.R. Geological Survey, Denver, CO (USA). 1990. 179p. Sponsored by U.S. DOE Radioactive Waste Management; U.S. Geological Survey. DOE Contract AI08-78ET44802. Order Number DE91000132. Source: NTIS, PC A09/MF A01; OSTI; INIS; USGS, Books and Open-File Reports Section, Box 25425 Federal Center, Denver CO 80225; GPO Dep.

Volcanic rock samples collected from the Nevada Test Site, Nye County, Nevada, between 1960 and 1985 were analyzed by thin section to obtain petrographic mode data. In order to provide rapid accessibility to the entire database, all data from the cards were entered into a computerized database. This computer format will enable workers involved in stratigraphic studies in the Nevada Test Site area and other locations in southern Nevada to perform independent analyses of the data. The data were compiled from the mode cards into two separate computer files. The first file consists of data collected from core samples taken from drill holes in the Yucca Mountain area. The second group of samples were collected from measured sections and surface mapping traverses in the Nevada Test Site area. Each data file is composed of computer printouts of tables with mode data from thin section point counts, comments on additional data, and location data. Tremendous care was taken in transferring the data from the cards to computer, in order to preserve the original information and interpretations provided by the analyzer. In addition to the data files above, a file is included that consists of Nevada Test Site petrographic data published in other US Geological Survey and Los Alamos National Laboratory

reports. These data are presented to supply the user with an essentially complete modal database of samples from the volcanic stratigraphic section in the Nevada Test Site area. 18 refs., 4 figs.

51890 Geologic significance of remotely sensed physiographic features of the Texas Panhandle and adjacent regions. Collins, E.W. 39p. University of Texas Bureau of Economic Geology, Austin, TX (USA) (1990).

Remotely sensed features such as linear drainages, escarpments, ridges, and aligned playas were identified on 1:250,000-scale Landsat images of the Texas Panhandle, eastern New Mexico, and the Oklahoma Panhandle and compared with detailed regional and site-specific geologic data from 32 field stations in these areas. The physiographic regions studied are the High Plains, Canadian Breaks, Rolling Plains, Pecos Valley, and Raton section. The authors collected structural data at the near features depicted on the 63 remotely sensed images, thus providing a case study of the correlation of surface and subsurface geologic data with remotely sensed features in areas of differing physiography. Results show that about 70 percent of the drainages, escarpments, and ridges coincide with the orientations of fracture sets, faults, or dikes in all areas except the low-relief High Plains. Detailed statistical analyses of lineaments performed for this study indicate that lineament interpretations only partly reflect the orientations of fracture sets and the structural grains of subsurface strata; thus, the combination of remotely sensed data and geologic data offers a more complete assessment of the surficial geology of the Texas Panhandle.

51891 Uses of probability graphs for the characterization of fractured rock aquifers near Oak Ridge, Tennessee. Moore, G.K. (Oak Ridge National Laboratory, TN (USA)). pp. 57-65 of Recent advances in ground-water hydrology. Moore, J.E.; Zaporozec, A.A.; Csallany, S.C.; Varney, T.C. (eds.). American Institute of Hydrology, Minneapolis, MN (US) (1989). pp. 645 DOE Contract AC05-84OR21400. (CONF-881166–: Symposium on recent advances in ground-water hydrology, Tampa, FL (USA), 16-19 Nov 1988).

Hydrologic parameters in the fractured rock aquifers near Oak Ridge National Laboratory have a large numeric range, little correlation with other parameters, and abrupt changes in spatial relationships. Tools such as contour maps and regression analyses have limited utility in this area and can produce misleading results. The problem apparently results from nearly unique conditions along each of the many aquifer flow paths. In this situation, the best approach to parameter characterization may be a graphical method of statistical analysis. Cumulative probability graphs require a fairly large amount of data but may show sample or population deviations that otherwise would have been obscure. Some deviations represent only an imperfect distribution of sample values, but others show some type of control on population characteristics. A correct interpretation of the significant deviations can contribute to an understanding of groundwater occurrence and flow paths. All tested parameters in the study area plot as lognormal distributions. On each graph, the slope of the fitted population line shows the change in probability per unit change in parameter value. Any classification of data within a population shows differences, which may or may not be statistically significant, in geometric means and shows nearly identical standard deviations.

51892 Advances in coupling hydrologic transport and geochemical equilibria. Yeh, G.T. (Oak Ridge National Laboratory, TN (USA)); Tripathi, V.S. pp. 380-393 of Recent advances in ground-water hydrology. Moore, J.E.; Zaporozec, A.A.; Csallany, S.C.; Varney, T.C. (eds.). American Institute of Hydrology, Minneapolis, MN (US) (1989). pp. 645 (CONF-881166–: Symposium on recent advances in ground-water hydrology, Tampa, FL (USA), 16-19 Nov 1988).

Three approaches have been used to formulate the coupled hydrologic transport and geochemical equilibria of reactive multispecies systems: (1) the mixed differential and algebraic equation (DAE) approach, (2) the direct substitution approach (DSA), and (3) the sequential iteration approach (SIA). An extremely important consideration in any approach is the choice of primary dependent variables (PDVs). Six types of PDVs have been employed in the existing models: (1) concentrations of all species, (2) concentrations of all component species and precipitated species, (3) total analytical concentrations of aqueous components, (4) total dissolved concentrations of aqueous components, (5) concentrations of aqueous component species, and (6) hybrid (combination of) concentrations. Because of many possible combinations of PDVs and approaches, many hydrogeochemical transport models for multi-species systems have been developed. This paper review and evaluates these models in terms of: (1) the requirement of computing resources, (2) the variety of geochemical processes, and (3) extendibility to include mixed kinetic and equilibrium reactions.

51893 The long-term measurement of strong-motion earthquakes offshore southern California. Sleefe, G.E. (Sandia National Labs., Albuquerque, NM (USA)). pp. 561-568 of Proceedings of the 22nd annual offshore technology conference: Volume 2. Offshore Technology Conference, Richardson, TX (USA) (1990). pp. 649 DOE Contract AC04-76DP00789. (CONF-900507–: 22. offshore technology conference and exhibition (OTC '90), Houston, TX (USA), 7-10 May 1990).

Technical Paper OTC 6336.

This paper describes a new long-life seafloor earthquake measurement system (SEMS) and presents earthquake data obtained from the seafloor near an offshore oil production field. The SEMS is a battery-powered (8 year life) digital data acquisition system which telemeters data via a sonar link. Seafloor earthquake data from SEMS indicate the seafloor vertical acceleration is nearly an order of magnitude weaker than the corresponding on-shore vertical motions. The importance of the SEMS measurements in designing earthquake-resistant offshore structures is also described.

51894 High resolution subsurface imaging with geophysical diffraction tomography. King, W.C. (Fitzsimons Army Medical Center, Aurora, CO (USA)); Witten, A.J. pp. 813-826 of The proceedings of the third national outdoor action conference on aquifer restoration, ground water monitoring and geophysical methods. National Water Well Association, Dublin, OH (US) (1989). pp. 1161 (CONF-8905127–: 3. National Water Well Association outdoor action conference, Orlando, FL (USA), 22-25 May 1989).

This paper describes the evolution of a promising new technique for subsurface remote sensing, geophysical diffraction tomography, from its theoretical formalism to its current state as a proven field technique capable of high resolution imaging of natural and buried subsurface features. The paper begins with a brief introduction of the concept of diffraction tomography and a review of the theoretical development of a scheme for implementing diffraction tomography in a geophysical imaging technique. Next, the field procedure is described. The final topic for this paper, and its primary objective, is to present results of three recent field tests of the system.

51895 Theis' contribution and parallel developments in the earth sciences. Narasimhan, T.N. (Lawrence Berkeley Laboratory, CA (USA)). pp. XXXII-XXXVII of Recent advances in ground-water hydrology. Moore, J.E.; Zaporozec, A.A.; Csallany, S.C.; Varney, T.C. (eds.). American Institute of Hydrology, Minneapolis, MN (US) (1989). pp. 645 DOE Contract AC03-76SF00098. (CONF-881166–: Symposium on recent advances in ground-water hydrology, Tampa, FL (USA), 16-19 Nov 1988).

The fact that Charles V. Theis has a unique position in the history of groundwater hydrology is well attested by this conference, which seeks to pay tribute to his memory. Theis made his noteworthy contribution on unsteady groundwater flow during a period when exciting progress was being made in many disciplines closely related to groundwater hydrology. This paper is a commemoration which reflects on the evolution of ideas in hydrogeology during a period from the early 1920's to the early 1940's. The philosophical importance of Theis' contribution lies in the recognition of the importance of the time dimension and the related recognition that time cannot be formally considered without the storage term. In a broad sense, the development of the idea of storage coefficients provided a basis for unifying the diverse perspectives of Gardner, Terzaghi, Richards, Hurst, Muskat, Theis and numerous others which are discussed in this text.

51896 (AD-A–223355/9/XAB) **Feasibility of cosmic-ray-muon intensity measurements for tunnel detection. Final report, February 1989-February 1990.** Celmins, A. Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab. Jun 1990. 40p. (BRL-TR–3110). Source: NTIS, PC A03/MF A01.

Subsurface cosmic-ray muon intensity depends on the amount of material above the point of reference and is therefore influenced by anomalies in rock density. Because such anomalies might be caused by geological structures (e.g. ore bodies), cosmic-ray intensity measurements have been used for geophysical exploration. Recently, cosmic-ray muon intensity measurements have been also proposed as a method to detect tunnels. The feasibility of this application depends on the type of radiation detection apparatus (it must fit into a bore hole) and on the magnitude of the signal by a tunnel. If the signal is too weak, then the required observation times are estimated for a projected bore-hole radiation detector and for tunnels with a 2 m diameter. The estimates show that a reasonable upper bound for the detector depth is about 30 to 40 m if the observations are to be used in a tomographic reconstruction of th density field. The required observation times at that depth are of the order of days. The upper bound for the depth of detectable tunnels is less than the quoted bound for the detector depth. It might be possible to use the method at greater depths if special data interpretation techniques are developed that take into account prior knowledge about the tunnel, e.g. its anticipated direction.

51897 (AD-A–223428/4/XAB) **5-minute oscillation in the solar photosphere: Theoretical behavior versus observations.** Marmolino, C.; Stebbins, R.T. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 1989. 9p. (GL-TR–90-0164). Source: NTIS, PC A02/MF A01.

Pub. in Societa Astronomica Italiana, Memorie, Vol. 60, No. 1-2, 71-78(1989).

Computed and observed frequencies, for the five minute oscillation, disagree is a significant way for the higher degree modes, indicating that the models cannot adequately represent these modes in the very surface layers where they are confined. To examine if and how these discrepancies extend to the eigenfunctions, we report detailed comparisons between theoretical and empirical eigenfunctions of velocity and intensity for the five minute modes in the photosphere. The comparison process is accomplished by obtaining synthetic profiles of the FeI lambda 5434 lambda line in the presence of waveforms given by dynamical calculations and then applying a common procedure of reduction both to the observed and to the synthetic data. For the velocity waveforms, our results show a general agreement between theory and observations together with some systematic differences; in particular the theory systematically underestimates the observations in the low photosphere. These systematic differences are stressed by the intensity results since both the computed amplitudes and phases appear to be wrong, particularly in the deeper layers.

51898 (AD-A–223607/3/XAB) **Simulation of large-scale flows at the solar surface.** Simon, G.W.; Weiss, N.W. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 15 Oct 1989. 20p. (GL-TR–90-0160). Source: NTIS, PC A03/MF A01.

Pub. in Astrophysical Jnl. Vol. 345, 1060-1078(15 Oct 1989).

A simple analytic axisymmetric function will represent the radial outflow associated with an isolated convection plume at the solar surface. The vertical velocity can be deduced from the continuity equation. A regular cellular pattern of convection can be created by superposing a number of such sources. Our motivation for this study came from the large-scale horizontal motions observed by the SOUP instrument on Spacelab 2. The flow pattern is simulated as visible in three different regions covered by the SOUP observations. In each case a superposition of our plume functions mimics the observed mesogranular and supergranular motions remarkably well. The model can be improved by using the same procedure to represent sinks as well as sources in the observed velocity field. We use these model flows to compute the motion of passive test particles (corks) which accumulate in a network that outlines mesogranular cells. The cork patterns closely resemble the magnetic network observed at the time of the SOUP measurements. Detailed comparisons suggest that magnetic flux tubes are affected more by outflow from sources at the centers of mesogranules than by flow into sinks within the network.

51899 (ESA-SP–302) **Physics and Mechanics of Cometary Materials.** Hunt, J.; Guyenne, T.D. (eds.). European Space Agency, 75 - Paris (France). 1989. 246p. Source: NTIS (US Sales Only), PC A11/MF A01.

Some preliminary experiments exploring the isotopic exchange of water and CO_2 at low temperature are reported. The results indicate that isotopic signatures of these components may be lost even at sub-ambient temperatures and thus have implications for the storage of cometary nucleus samples during return to Earth. Photochemically produced organics are made up of species with different stability to combustion including some of high volatility and others which are quite refractory. These materials are worthy of consideration as cometary analogues for use in preparing for the return of cometary nucleus samples. Their study could also help in the interpretation of the data which will eventually be gathered from the comet samples themselves.

51901 (ESA-SP–302, pp. 77-82) **Thermal conductivities and diffusivities of porous ice samples at low pressures and temperatures and possible modes of heat transfer in near surface layers of comets.** Spohn, T.; Seiferlin, K.; Benkhoff, J. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials*. 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

Thermal conductivities of solid water ice, porous water ice and porous water ice/dust samples with porosities between 0.5 and 0.6 have been measured at a pressure of 1 Pa and at temperatures between 80 K and 170 K. The thermal conductivity was found to be 0.25 ± 0.05 W m^{-1} K^{-1} and to depend little on temperature and composition in the range of values considered. Thermal diffusivities and ratios between rates of matrix conductive heat transfer and heat transfer due to vapor flow have been estimated from the results of recent KOSI comet simulation experiments. The thermal diffusivities were between 10^{-7} and 10^{-8} m^2s^{-1} and the ratio between vapor and matrix conductive heat transfer was 10. Water vapor heat transfer is most likely less important if the near surface temperature of the Rosetta target comet is below 150 K. It is still possible, however, that vapors of more volatile phases contribute significantly to heat transfer.

(Istituto Universitario Navale, Naples (IT)); Strazzulla, G.; Colangeli, L. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials*. 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

We describe in this paper some of the main laboratory results concerning amorphous carbon production and organic ice irradiation. The experimental data are used to reproduce P/Halley's and other cometary IR spectra. The results indicate that the above mentioned materials appear to be among the best candidates to simulate the actual carbonaceous and organic components in comets.

51903 (ESA-SP–302, pp. 65-70) **Laboratory studies of cometary ice analogues.** Schmitt, B. (Laboratoire de Glaciologie et Geophysique de l'Environnement, 38 - St. Martin d'Heres (FR)); Espinasse, S.; Klinger, J.; Grim, R.J.A.; Greenberg, J.M. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

Laboratory studies have been performed in order to simulate the physico-chemical processes that are likely to occur in the near surface layers of short and intermediate period comets. Pure H_2O ice as well as $CO:H_2O$, $CO_2:H_2O$, $CH_4:H_2O$, $CO:CO_2:H_2O$ and $NH_3:H_2O$ ice mixtures have been studied in the temperature range between 10 and 180 K. The evolution of the composition of ice mixtures, the crystallization of H_2O ice as well as the formation and decomposition of clathrate hydrate by different processes have been studied as a function of temperature and time. Using our results together with numerical modeling predictions are made about the survival of amorphous ice, CO, CO_2, CH_4 and NH_3 in the near surface layers of short period comets. The likeliness of finding clathrate and molecular hydrates is also discussed. It is proposed that the analytical methods developed here could be fruitfully adapted to the analysis of returned comet samples.

51904 (ESA-SP–302, pp. 55-64) **Physical processes in cometary ices inferred from laboratory studies.** Klinger, J. (Laboratoire de Glaciologie et de Geophysique de l'Environnement, 38 - St. Martin d'Heres (FR)). European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

Based on recent laboratory studies, an overview is given of the properties of various ices and ice mixtures condensed at low temperatures and on their evolution during heating up to temperatures typical of the perihelion temperatures of short period comets. The kinetics of formation and of decomposition of clathrate hydrates and molecular hydrates is briefly outlined and the possibility of their occurrence in comet nuclei is discussed. Special attention is given to the thermal behavior of amorphous and fluffy icy material.

51905 (ESA-SP–302, pp. 197-200) **Some considerations on cohesive forces in sun-grazing comets.** Klinger, J. (Laboratoire de Glaciologie et de Geophysique de l'Environnement, 38 - St Martin d'Heres (FR)); Espinasse, S.; Schmitt, B. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

Using a theory developed by Aggarwal and Oberbeck on tidal disruption of rigid bodies, an estimate is given for the internal cohesion of prominent sun-grazers. Considering the comet as a fluffy body, requirements are set on the tensile strength of the matrix material.

51906 (ESA-SP–302, pp. 191-196) **CO_2 depth profiles in cometary model substances of KOSI.** Hsiung, P. (Kernforschungsanlage Juelich G.m.b.H. (DE). Inst. fuer Chemie); Roessler, K. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

The CO_2 content of cometary analogs used in comet simulation experiments (KOSI-3) and (KOSI-4) was measured by gaschromatography. CO_2 depth profiles were determined after insolation in cm layers taken from the samples which orginally contained 14-15% frozen CO_2. These profiles show an upper layer completely depleted of the volatile component, while the deeper layers are not affected. Of special interest is a transition layer where the CO_2 content ranges from 0% to a value which is higher than that of the starting material (> 20%). This is interpreted as inward diffusion of CO_2 which can recondense in colder zones. In addition a correlation with the temperature profiles has been observed. The upper and lower layers show a rather constant but different temperature, while a very steep temperature gradient is found in the transition layer. The water-ice profile did not show any significant change with respect to the starting material.

51907 (ESA-SP–302, pp. 185-190) **A method of estimating temperature profiles and chemical differentiation in the near surface layers of porous comet nuclei - first results for comet P/Churyumov-Gerasimenko.** Espinasse, S. (Laboratoire de Glaciologie et de Geophysique de l'Environnement, St. Martin d'Heres (FR)); Klinger, J.; Ritz, C.; Schmidt, B. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

A method is presented for a quantitative estimation of thermal gradients and chemical differentiation in porous icy mixtures. This method has been applied to comet nuclei containing different volatile species with special attention given to subsurface layers. Heat conduction by the solid as well as heat and mass transport by the gas phase in the pore system are included. Based on recent laboratory studies, the influence of the crystallization of amorphous ice on the thermal behavior and the gas release is also considered. First results are presented for comet P/Churyumov-Gerasimenko.

51908 (ESA-SP–302, pp. 177-184) **Hot OH and CN - evidence for organic molecules close to the nucleus of comet Halley.** Clairemidi, J. (Observatoire de Besancon, 25 (FR)); Moreels, G. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

During the encounter session of Vega 2 with comet Halley on March 6, 1986, advantage was taken of the approach motion and of the resulting zoom effect to assemble the monochromatic charts produced by the three-channel spectrometer in composite images at selected wavelengths. Two jets are clearly apparent in most of the monochromatic images. The OH and CN emissions originating from the jets exhibit a pronounced peculiarity. The bands located at 309 and 388 nm show an excess of emission at 305 and 383 nm. The proposed mechanism, specific of the jets, is the photodissociation of one or several organic molecules of the type A-OH or B-CN which would release hot OH and CN when submitted to the solar UV flux. These organic molecules would be a component of the envelope of the CHON submicronic grains dragged by the gaseous jets. They provide an additional argument in favor of the similarity between cometary and interstellar matter.

51909 (ESA-SP–302, pp. 173-176) **Low velocity dust-dust collisions.** Blum, J. (Max-Planck-Institut fuer Kernphysik, Heidelberg (DE)); Fechtig, H. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

An experimental setup has been developed to investigate collisional processes between protoplanetary/protocometary particles. The relative velocities of the order-of-mm-sized particles can be varied from $\approx$ 10cm/s to $\approx$ 10m/s. The first experiments were performed with fluffy agglomerates of particles each consisting of a glass core and an organic mantle (n-pentacosane) at relative velocities around 1.2m/s. No sticking of the collided agglomerates

was observed for relative amounts of n-pentacosane $\leq$17 weight%, whereas sticking was observed for relative amounts of organic material $\geq$22 weight%. The coagulation probability increases with increasing proportion of n-pentacosane.

51910 (ESA-SP–302, pp. 167-172) **Cometary bodies in the circumstellar disk around β Pictoris.** Beust, H. (Centre National de la Recherche Scientifique, 75 - Paris (FR). Inst. d'Astrophysique); Lagrange-Henri, A.M.; Vidal-Madjar, A.; Ferlet, R. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

The IRAS star β Pictoris is still the only one around which a disk made of both dust and gas has been detected. Spectroscopic observations of β Pic have revealed that some metallic absorption lines present redshifted additional components which strongly variate with time. This has been interpreted as the result of the infall of small evaporating cometary-like bodies toward the star. To improve this model, a theoretical description of such an event has been purchased. Numerical simulations of such infalling bodies have been able to reproduce quite faithfully the observed behaviour of some metallic ions, and we have explained the observed difference between these behaviours by means of radiation pressure. Some constraints on the orbits of the bodies have been deduced by through the simulations which should be related to a possible interpretation concerning β Pic's disk.

51911 (ESA-SP–302, pp. 129-140) **Simulation of radar and radiometer signals remote sensing cometary surface and subsurface structures.** Edenhofer, P. (Bochum Univ. (DE)); Noll, J. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

Results of numerical calculations in the microwave range are presented concerned with the reflection, backscattering, and emission coefficient of simulated cometary surfaces as a function of signal frequency, angle of incidence, polarization, and surface roughness. The variations of the dielectric permittivity and loss tangent are estimated as to be expected for typical cometary surface conditions. The spatial resolution of potential Rosetta radar measurements is discussed. The subsurface penetration depth is given and a one-layer model is introduced. Preliminary results from experimental investigations are also presented simulating radar measurements probing a cometary surface in the frequency range 8 to 12.5 GHz. A special calibration technique using time domain transformation is applied to resolve the cometary reflection coefficient against background noise as to be expected in a simulation chamber. The results are discussed for different surface conditions and it is shown how specific surface and subsurface parameters can be determined.

51912 (ESA-SP–302, pp. 121-128) **Fracture mechanical aspects of dust emission processes from a model comet surface.** Ratke, L. (German Aerospace Establishment, Koeln (DE)); Kochan, H. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

High resolution video records taken from the virgin surface of a model comet in the small simulation chamber at the DLR showed a highly structured, rough surface during irradiation with artificial sun light. The observations demonstrated: 1. The surface itself is not calm, but partially in motion. Particles vibrate within the gas jet originating from sublimation of ice. After a certain time they lift off. 2. Particles which are obviously bonded to the surface loose after a certain time the bonds to their neighbours until they are free and accelerated by the gas jet. The observations show that the commonly considered view of dust emission processes by gravity force dominated particles has to be revised as well as the supposition of loosely deposited particles at fresh surfaces without any bonding. Model calculations of bond strength based on material parameters of ice show that these can be orders of magnitude higher than the gravity force. The mechanisms observed are analysed with fracture mechanical models, which are also applicable to the fracture of a cometary crust.

51913 (ESA-SP–302, pp. 205-208) **Gas diffusion in a cometary crust.** Koemle, N.I. (Graz Univ. (AT)); Steiner, G.; Banaszewskiewicz, M. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

It is generally believed that parts of the surface of a cometary nucleus are coated by non - volatile dust mantles, below which the cometary ice is buried. These dust mantles may be either extremely loose structures or they may exhibit some internal cohesion. In any case they are expected to be rather fluffy and porous, so that the vapour sublimated from the underlying ice is able to flow outward through the pores of such a mantle. We first give some critical comments regarding the validity of the Knudsen diffusion formula, which is generally used for the gas outflow through a cometary dust mantle at low densities, and subsequently present an alternative model for the gas flow through straight capillaries based on a Monte Carlo calculation. The results are compared with those given by the simple Knudsen diffusion formula, and the differences between these two approaches are discussed. Finally the relevance of the Monte Carlo model for the interpretation of recent KOSI experiments is pointed out.

51914 (ESA-SP–302, pp. 201-204) **Possible triggering of particle emission by mechanical stress and penetration of sublimating ice-dust-surfaces.** Kohl, H. (Max-Planck-Institut fuer Kernphysik, Heidelberg (DE)); Gruen, E.; Baghul, M.; Koelzer, G.; Thiel, K.; Kochan, H. European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

Laboratory simulation experiments have shown that sublimating surfaces of ice-dust mixtures are unstable against mechanical stress. This instability may be caused by a pressure gradient within the uppermost layers of the simulated cometary surface. Different kinds of stress, such as penetration, pressure change a low velocity particle impact were examined. In every case sudden increase of dust emission activity was observed. Evidence for real comets and possible consequences for the Rosetta mission are discussed.

51915 (ESA-SP–302, pp. 209-214) **Porosity and ice-dust mixtures in cometary particles.** Levasseur-Regourd, A.C. (Paris-6 Univ., 75 (FR)). European Space Agency, 75 - Paris (France). 1989. (CONF-8910423–: Conference on physics and mechanics of cometary materials, Muenster (Germany, F.R.), 9 Oct 1989). In *Physics and Mechanics of Cometary Materials.* 246p. Order Number DE91709432. Source: NTIS (US Sales Only), PC A11/MF A01.

Numerous and consistent observations of light scattered by cometary dust allow to derive accurately the degree of linear polarization as a function of the phase angle, and the bulk geometric albedo. The derived values are typical of rough, pitted or aggregated textures. The decay with decreasing solar distance of interplanetary grains spiralling towards the Sun may be a clue to the thermal evolution of the coating which aggregates the cometary grains. The results indicate some break off of the clumps of grains, some loss of organic mantles by heating and the existence of various populations of dust particles.

51916 (IAE–4739-1) **Unified geometric theory of gravitation and electromagnetism: 4. Cosmological solutions.** Bryushinkin, S.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1988. 8p. (In Russian). Order Number DE91603017. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Homogeneous isotropic cosmological solutions in a 5-D space with two timelike dimensions. In the model with a non-zero density of an energy-momentum tensor the Universe expansion splits into two phases: the exponential and the conventional Fridman-type one, each phase is characterized by its Hubble constant. The large

value of the quasar component flying apart exceeding the velocity of light. 7 refs.

51917 (LA-UR-90-3059) **Nonlinear pulsation masses.** Davis, C.G. Los Alamos National Lab., NM (USA). [1990]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-9005249-6: Confrontation between stellar pulsation and evolution, Bologna (Italy), 28-31 May 1990). Order Number DE91000364. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The advent of nonlinear pulsation theory really coincides with the development of the large computers after the second world war. Christy and Stobbie were the first to make use of finite difference techniques on computers to model the "bumps" observed in the classical Cepheid light and velocity curves, the so-called "Hertzsprung" sequence. Following this work a more sophisticated analysis of the light and velocity curves from the models was made by Simon and Davis using Fourier techniques. Recently a simpler amplitude equation formalism has been developed that helps explain this resonance mechanism. The determination of Population I Cepheid masses by nonlinear methods will be discussed. For the lower mass objects, such as RR Lyrae and BL Her. stars, we find general agreement using evolutionary masses and nonlinear pulsation theory. An apparent difficulty of nonlinear pulsation theory occurs in the understanding of "double" mode pulsation, which will also be discussed. Recent studies in nonlinear pulsation theory have dealt with the question of mode selection, period doubling and the trends towards chaotic behavior such as is observed in the transition from W Virginis to RV Tauri-like stars. 10 refs., 1 fig., 2 tabs.

51918 (LA-UR-90-3072) **Radioactive targets for nuclear astrophysics research at LANSCE.** Koehler, P.E.; O'Brien, H.A.; Gursky, J.C. Los Alamos National Lab., NM (USA). [1990]. 15p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9009161-1: 15. world conference of the International Nuclear Target Development Society: special high-purity materials and targets, Santa Fe, NM (USA), 10-14 Sep 1990). Order Number DE91000426. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

During the past few years we have made measurements of (n,p) and (n,α) cross sections on several radioactive nuclei of importance to nuclear astrophysics. The measurements were made at the Manuel Lujan, Jr., Neutron Scattering Center (LANSCE) from thermal neutron energy to approximately 100 keV. Successful measurements have been completed on the radioisotopes ^{7}Be, ^{22}Na and ^{36}Cl while preliminary data have been taken on targets of ^{54}Mn and ^{55}Fe. Similar measurements have also been made on the stable isotopes ^{14}N, ^{17}O and ^{35}Cl. We are currently assembling a 4π barium fluoride (BaF_2) detector which will allow us to expand our program to (n,γ) measurements. The (n,γ) (and in some cases future (n,p)) measurements will require targets with higher specific activity and greater chemical purity than we have so far been able to use. We discuss the fabrication techniques used for the samples produced so far, the requirements the future (n,γ) targets must meet and our current plans for producing them, and the physics motivations for the measurements.

51919 (PB-90-251224/XAB) **Solar-Geophysical Data Number 549, May 1990. Part 1 (Prompt Reports). Data for April, March 1990, and late data.** Coffey, H.E. National Geophysical Data Center, Boulder, CO (USA). May 1990. 165p. (SGD-549-PT-1). Source: NTIS, PC A08/MF A01.

Contents: data for April 1990-(solar-terrestrial environment, IUWDS alert periods, solar activity indices, solar flares, solar radio emission, and stanford mean solar magnetic field); data for March 1990-(solar active regions, sudden ionospheric disturbances, Pioneer XII interplanetary magnetic field magnitudes, solar radio spectral observations, geomagnetic indices, and radio propagation indices); late data-(nancay interferometric chart Mar 90, geomagnetic activity indices Feb 90, sudden commencements Dec 89-Jan 90, Pioneer XII solar wind data 1989, and forbush decreases Mt. Washington 1954-1990).

51920 (PB-90-251232/XAB) **Solar-Geophysical Data Number 549, May 1990. Part 2 (Comprehensive reports). Data for November 1989 and miscellaneous.** Coffey, H.E. National Geophysical Data Center, Boulder, CO (USA). May 1990. 102p. (SGD-549-PT-2). Source: NTIS, PC A06/MF A01.

See also PB-90-251224.

Contents: solar flares; solar radio bursts at fixed frequencies; interplanetary solar particles and plasma; solar x-ray radiation from GOES satellite graphs; mass ejections from the sun; active prominences and filaments.

51921 (PB-90-256330/XAB) **White Light Solar Corona: An Atlas of 1988 K-Coronameter Synoptic Charts, December 1987-January 1989. Technical note.** Sime, D.G.; Garcia, C.; Yasukawa, E.; Lundin, E. High Altitude Observatory, Boulder, CO (USA). Mar 1990. 87p. (NCAR/TN-346+STR). Source: NTIS, PC A05/MF A01.

See also PB-87-196382.

The synoptic observing project of the High Altitude Observatory's Coronal Dynamics Program began on 30 July 1980. The data obtained for it are gathered by the Mark-III K-coronameter located at the Mauna Loa Solar Observatory, Hawaii, and are published yearly in volumes of The White Light Solar Corona: An Atlas of K-Coronameter Synoptic Charts (Table 1). The data, in the form of synoptic charts, are extended at both the beginning and the end of each year to provide some overlap with the preceding and succeeding volumes. This is also necessary to provide a complete set of the data organized into Carrington rotations covering a specific time period, since the rotations do not coincide with the yearly calendar. Further observations are made at the limb, and west limb passage occurs 14 days after east limb passage. Thus, an entire rotation's data requires more than 28 days to collect. Together with the synoptic maps and polar synoptic maps, two additional sections designed to aid the user are included in the volume. As in previous Atlases, the Activity Report Summary for the year is given and the Mauna Loa Solar Observatory Calendar for 1988 (Table III) is also included. This is a list of days on which no coronal observations were achieved. These synoptic data should be regarded as a preliminary presentation in which corrections have not fully been made for the day-to-day variations and scattering of polarized light by the earth's atmosphere. Data from the east and west limbs are presented separately in the synoptic charts, as transient and evolutionary changes in the white light corona can substantially modify the distribution of coronal material over the 14 days between sequential limb passages.

51922 (PB-90-258799/XAB) **Solar-Geophysical Data Number 550, June 1990. Part 1 (Prompt Reports). Data for May, April 1990 and late data.** Coffey, H.E. National Geophysical Data Center, Boulder, CO (USA). Jun 1990. 151p. (SGD-550-PT-1). Source: NTIS, PC A08/MF A01.

See also PB-90-258799.

Contents: detailed index for 1989-1990; data for December 1989-solar flares, solar radio bursts at fixed frequencies, interplanetary solar particles and plasma, solar x-ray radiation from GOES satellite, mass ejections from the sun, active prominences and filaments; miscellaneous data-Meudon Carte synoptique-Carrington rotations 1820-1821 September-October 1989, interplanetary solar plasma-IMP-8 solar wind July-November 1989.

51924 (PSC-8) **X-ray emission due to interaction of SN1987A ejecta with its progenitor's stellar-wind matter.** Masai, Kuniaki. Nagoya Univ. (Japan). Plasma Science Center. Jun

1990. 17p. Order Number DE91713050. Source: NTIS (US Sales Only), PC A03/MF A01.

The progenitor of the supernova 1987A, Sk-69 202 probably had lost a considerable amount of mass in its stellar wind in the past evolutionary track through a red supergiant to a blue supergiant. In about 10 years, the expanding ejecta of SN1987A will catch up to collide with the wind matter ejected in the red supergiant phase. Shocks due to the collision will heat up the ejecta and the wind matter to cause an enhancement of thermal X-ray emission lasting for several decades. We predict the X-ray light curve and the spectrum as well as the epoch of the enhancement intending to encourage future X-ray observations, which will give a clue for the study of such peculiar stellar evolution with a blueward transition as Sk-69 202. (author).

51925 (TRITA-EPP-90-04) **Complementary aspects on matter-antimatter boundary layers.** Lehnert, B. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics. May 1990. 31p. Order Number DE91603008. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

This paper gives some complementary aspects on the problems of the matter-antimatter metagalaxy model and its cellular structure, as being proposed by Klein and Alfven. A previously outlined one-dimensional model of a magnetized matter-antimatter boundary layer is updated and extended, by introducing amended nuclear annihilation data, and by making improved approximations of the layer structure and its dependence on relevant parameters. The critical beta value obtained from this model leads to critical plasma densities which are not high enough to become reconcilable with a cellular matter-antimatter structure within the volume of a galaxy. Additional investigations are required on the questions whether the obtained beta limit would still apply to cells of the size of a galaxy, and whether large modification of this limit could result from further refinement of the theory and from the transition to a three-dimensional model. Attention is called to the wide area of further research on ambiplasma physics, and on a three-dimensional cell structure with associated problems of equilibrium and stability. In particular, the high-energy ambiplasma component has to be further analysed in terms of kinetic theory, on account of the large Larmor radii of the corresponding electrons and positrons.

51926 (UCRL-JC-104996) **Bragg crystal polarimeter for the Spectrum-X-Gamma mission.** Holley, J. (Lawrence Livermore National Lab., CA (USA)); Silver, E.; Ziock, K.P.; Novick, R.; Kaaret, P.; Weisskopf, M.; Elsner, R.; Beeman, J. Lawrence Livermore National Lab., CA (USA). 13 Aug 1990. 13p. Sponsored by U.S. DOE Defense Programs; National Aeronautics and Space Administration. DOE Contract W-7405-ENG-48. (CONF-900756-45: SPIE's international symposium on optical and optoelectronic applied science and engineering exhibit, San Diego, CA (USA), 8-13 Jul 1990). Order Number DE91000256. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We are designing a Bragg crystal polarimeter for the focal plane of the SODART telescope on the Spectrum-X-Gamma mission. A mosaic graphite crystal will be oriented at 45° to the optic axis of the telescope, thereby preferentially reflecting those x-rays which satisfy the Bragg condition and have electric vectors that are perpendicular to the plane defined by the incident and reflected photons. The reflected x-rays will be detected by an imaging proportional counter with the image providing direct x-ray aspect information. The crystal will be $\approx$50 μm thick to allow x-rays with energies $\geq$4 keV to be transmitted to a lithium block mounted below the graphite. The lithium is used to measure the polarization of these high energy x-rays by exploiting the polarization dependence of Thomson scattering. The development of thin mosaic graphite crystals is discussed and recent reflectivity, transmission, and uniformity measurements are presented. 8 refs., 11 figs., 1 tab.

51927 **Supernovae.** Petschek, A. (New Mexico Inst. of Mining and Technology, Socorro, NM (USA)). 293p. Springer-Verlag New York Inc., New York, NY (USA) (1990).

This book offers papers incorporating the latest results and understanding about supernovae, including SN1987A. There are several chapters reviewing all the radio through infrared, visible, and ultraviolet to X-rays and gamma-rays but also neutrinos. Other chapters deal with the classification of supernovae, depending on their spectra and light curves. Three chapters treat supernovae theory, including an idea of a fractal burning front and another on the behavior of neutron stars.

51928 **Adiabatic supernova expansion into the circumstellar medium.** Band, D.L. (Institute of Geophysics and Planetary Physics and Physics Dept., Lawrence Livermore National Lab., Livermore, CA (US)); Liang, E.P. pp. 69-72 of Supernova remnants and the interstellar medium. Roger, R.S.; Landecker, T.L. Cambridge University Press, New York, NY (USA) (1988). pp. 535 (CONF-8706201–: 101. International Astronomics Union colloquium on interaction of supernova remnants with the interstellar medium, Penticton (Canada), 8-12 Jun 1987).

The authors perform one dimensional numerical simulations with a Lagrangian hydrodynamics code of the adiabatic expansion of a supernova into the surrounding medium. The early expansion follows Chevalier's analytic self-similar solution until the reverse shock reaches the ejecta core. The authors follow the expansion as it evolves towards the adiabatic blast wave phase. Some memory of the earlier phases of expansion is retained in the interior even when the outer regions expand as a blast wave. They find the results are sensitive to the initial configuration of the ejecta and to the placement of gridpoints.

51929 **Models for x-ray emission from Tycho's remnant.** Smith, B.W. (Los Alamos National Lab., NM (USA)); Jones, E.M. pp. 133-136 of Supernova remnants and the interstellar medium. Roger, R.S.; Landecker, T.L. Cambridge University Press, New York, NY (USA) (1988). pp. 535 (CONF-8706201–: 101. International Astronomics Union colloquium on interaction of supernova remnants with the interstellar medium, Penticton (Canada), 8-12 Jun 1987).

The authors reexamine the x-ray emission from Tycho's remnant using results from hydrodynamic models computed with a detailed spherically symmetric code. The observed synchrotron radio contours appear to require a cloudy circumstellar medium. The authors explore the x-ray emission properties of similar models. They find that they tend to produce broad shells of x-ray emission that resemble the observed x-ray observations, but it has little similarity to the evolution of remnants in cloudy media dominated by thermal conduction. More work needs to be done to ensure that the spectrum as well as the x-ray map can be modeled with the same cloudy circumstellar medium, although we believe it will not be difficult to obtain as good as statistical agreement with the spectral data as other models have achieved.

51930 **Radio emission from young supernova remnants: Effects of an inhomogeneous circumstellar medium.** Dickel, J.R. (Illinois Univ., Urbana, IL (USA). Dept. of Astronomy); Eilek, J.A.; Jones, E.M. pp. 235-238 of Supernova remnants and the interstellar medium. Roger, R.S.; Landecker, T.L. Cambridge University Press, New York, NY (USA) (1988). pp. 535 (CONF-8706201–: 101. International Astronomics Union colloquium on interaction of supernova remnants with the interstellar medium, Penticton (Canada), 8-12 Jun 1987).

The evolution of young supernova remnants has been modeled using a 1-dimensional hydrodynamic code. Turbulent dynamo amplification of magnetic fields and both turbulent and shock acceleration of relativistic electrons have been included macroscopically to produce synchrotron radiation. The observed radio morphology cannot be reproduced by expansion into a homogeneous medium; it appears that many small cloudlets must be present in the circumstellar material.

51931 **Infrared spectroscopy and mapping of IC443.** Wright, G.S. (United Kingdom Infrared Telescope Unit, Hilo, HI (USA)); Longmore, A.J.; Graham, J.R. pp. 395-398 of Supernova remnants and the interstellar medium. Roger, R.S.; Landecker, T.L. Cambridge University Press, New York, NY (USA) (1988). pp. 535 (CONF-8706201–: 101. International Astronomics Union colloquium on interaction of supernova remnants with the interstellar medium, Penticton (Canada), 8-12 Jun 1987).

The authors present infrared (IR) spectroscopy and imaging of the supernova remnant IC443. [FeII] 1.644 μm, Brackett γ and H_2 1-0 S(1) were detected. The most striking feature of the spectra is the high [FeII] 1.644 μm/Brackett γ ratio, which is typically $\sim$ 30.

The authors argue that this ratio is due to shock excitation. Two maps of the remnant in the 1.644 μm [FeII] line are used to study the line excitation. The IR [FeII] line is a sensitive probe for regions of shocked gas which is especially useful where the extinction is high, or the shocks are too slow to excite optical lines.

51932 **IRAS observations of collisionally heated dust in Large Magellanic Cloud supernova remnants.** Graham, J.R. (Lawrence Berkeley Lab., CA (USA)); Evans, A.; Albinson, J.S.; Bode, M.F.; Meikle, W.P.S. pp. 383-386 of Supernova remnants and the interstellar medium. Roger, R.S.; Landecker, T.L. Cambridge University Press, New York, NY (USA) (1988). pp. 535 (CONF-8706201–: 101. International Astronomics Union colloquium on interaction of supernova remnants with the interstellar medium, Penticton (Canada), 8-12 Jun 1987).

IRAS additional observations show that luminous far-IR sources are associated with the Large Magellanic Cloud (LMC) supernova remnants N63A, N49, N49B, and N186D. Comparison of the IRAS and x-ray data shows that a substantial fraction of the IR emission from three of the SNRs can be accounted for by collisionally heated dust. The ratio of dust-grain cooling to total atomic cooling is $\sim$ 10 in x-ray emitting gas ($T \sim 10^6$ K). The authors show why dust cooling does not dominate, but probably speeds SNR evolution in an inhomogeneous interstellar medium.

51933 **Gravitational and dynamical instabilities of a decelerating plane-parallel slab of finite thickness.** Voit, G.M. (Center for Astrophysics and Space Astronomy, Univ. of Colorado, Boulder, CO (US)). pp. 509-512 of Supernova remnants and the interstellar medium. Roger, R.S.; Landecker, T.L. Cambridge University Press, New York, NY (USA) (1988). pp. 535 (CONF-8706201–: 101. International Astronomics Union colloquium on interaction of supernova remnants with the interstellar medium, Penticton (Canada), 8-12 Jun 1987).

In order to explore how supernova blast waves might catalyze star formation, the authors investigate the stability of a slab of decelerating gas of finite thickness. They examine the early work in the field by Elmegreen and Lada and Elmegreen and Elmegreen and demonstrate that it is flawed. Contrary to their claims, blast waves can indeed accelerate the rate of star formation in the interstellar medium. Also, the authors demonstrate that in an incompressible fluid, the symmetric and antisymmetric modes in the case of zero acceleration transform continuously into Rayleigh-Taylor and gravity-wave modes as acceleration grows more important.

51934 (AD-A–223370/8/XAB) **Studies of ionospheric dynamics utilizing data from DMSP. Final report, 1 January 1987-31 December 1989.** Heelis, R.A.; Hairston, M.R. Texas Univ., Richardson, TX (USA). Center for Space Sciences. 22 Feb 1990. 44p. Contract F19628-87-K-0014. Source: NTIS, PC A03/MF A01.

This report covers efforts primarily devoted to the reduction of ion drift meter data from the DMSP satellite. This work has required the development of sophisticated algorithms to generate in-situ ion drift velocity data with respect to the spacecraft and the derivation of an electrostatic potential distribution along the spacecraft track. This initial effort has been directed toward satisfying the needs of mathematical models of the high-latitude convection pattern, with some effort devoted to the improvement of the formulations currently in use. This report discusses the rationale for the preparation of data bases of the ion drift velocity and derived parameters from the DMSP data. The function of this computer code is described in detail to allow other users to make use of its capabilities.

Pub. in Planet Space Science, Vol. 38, No. 5, 653-663(1990).

Results of plasma measurements from the ionospheric sounding rocket MAIMIK are reported. Data obtained by high-resolution plasma probes show distinct classical wake signatures during the entire flight. That is, the electron temperature was enhanced behind the rocket in a region where both the electron and ion density were well below the ambient values. In addition, electron temperature enhancements were also detected in the ram (forward) direction on the downleg. The measurements are presented and discussed in relation to the prevailing ionospheric conditions.

51936 (AD-A–223660/2/XAB) **NASA radiation-belt models AP-8 and AE-8. Report for June-September 1989.** Jordan, C. Radex, Inc., Bedford, MA (USA). 30 Sep 1989. 26p. Contract F19628-89-C-0068. (SCIENTIFIC–1). Source: NTIS, PC A03/MF A01.

Empirical models AP-8 and AE-8 for the trapped protons and electrons in the Earth's radiation belts are currently available from NSSDC. These are the culmination of a series of models developed by J.I. Vette and colleagues. The initial models were begun in the mid-sixties with the most recent model, AE-8, being released in 1980. These models are based on data ranging from 1958 to 1970. They have been well documented by TREND, a group working under a contract with ESA, contains some information on this model. The only models which are still available from NSSDC are the most recent proton and electron models AP-8 and AE-8. This document contains a brief summary of the modeling efforts to date based on information from Lemaire, Spjeldvik, and Rothwell. Results from AE8MAX, results from the models previously used at GL (AE6MAX + AEI7HI), and results from code provided by NSSDC are compared.

51937 (AD-A–223685/9/XAB) **Feasibility study for D-region equatorial ionosphere research using VLF radio waves. Technical report, 1 May 1989-15 January 1990.** Hildebrand, V.E. IWG Corp., San Diego, CA (USA). 15 Jan 1990. 82p. Source: NTIS, PC A05/MF A01.

This research report establishes experiment feasibility and presents a plan to explore dynamic properties of the equatorial D-region ionosphere. The objective is to derive geophysical information on the lower ionosphere at nighttime in near equatorial regions through the use of a new VLF radiowave measurement method which uses ionosphere mode conversion. The measurement technique uses VLF signals, that when propagating at a range of azimuthal angles (typically 190 to 360 deg) through the equatorial region (about + or - 20 magnetic latitude), undergo marked mode conversion. The mode conversion, as predicted by theory and shown by measurement, is so strong that many modes become near equal in amplitude, even modes that when entering the equatorial zone are more than 30 dB below the dominant mode. Signals are strongly mode 1 on entering the mode conversion zone, thus converted modal components provide information on ionosphere parameters causing the mode conversion process. This process is shown to be highly sensitive to ionosphere parameters. Spaced receivers located just within the mode conversion zone will provide data from a small reflection region, even though the transmitter is far away. Theoretical models of VLF propagation, used in an iterative inversion process, infer the parameters of the ionosphere. Topics covered include; measurement concept, mode conversion theory and measurement, literature review, geophysics phenomena to explore, research goals, technical approach and experiment plan.

51938 (AD-A–223850/9/XAB) **Amplification of critical-velocity ionization by a pulsed neutral beam.** Lai, S.T.; McNeil, W.J.; Murad, E. Air Force Geophysics Lab., Hanscom AFB, MA (USA). May 1990. 5p. (GL-TR–90-0177). Source: NTIS, PC A01/MF A01.

Pub. in Geophysical Research Letters, Vol. 17, No. 6, 737-740(May 1990).

Numerical results of computer simulations on critical ionization velocity (CIV) discharges in pulsed neutral beams are presented. In a typical CIV scenario, neutral molecules as well as newly created ions are traveling across the ambient magnetic field. The ions slow down as they transfer kinetic energy to the electrons via plasma waves. For a single pulse of neutral gas, there is a finite contact time between the beam and the plasma; the contact time is governed by the length of the pulse and the velocity of neutrals. The injection of multiple pulsed neutral beam into a magnetized plasma has the advantage that succeeding pulses may extend the effective

contact time of a single pulse. Using the particle-in-cell method of computer simulations, we show a detailed time history of the CIV process as a result of the interplay between plasma (wave-particle) interactions and collisional (ionization, charge exchange) processes. It is found that ions slowing down and lagging behind the pulses can still contribute to electron heating. Simulation results show that CIV in a multiple pulsed beam is more efficient than that in a single continuous pulse.

51939 (LA-UR–90-2968) **Modeling of the quasi-steady magnetotail.** Birn, J. (Los Alamos National Lab., NM (USA)); Schindler, K. Los Alamos National Lab., NM (USA). [1989]. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8910462–1: Workshop on magnetosphere-ionosphere plasma models, Huntsville, AL (USA), 11-13 Oct 1989). Order Number DE91000444. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The three-dimensional theory of the quiet magnetotail is reviewed and updated. The most advanced formulation of the theory allows one to solve the magnetohydrodynamic (MHD) equations including field-aligned flow by reduction to a set of ordinary differential equations and an ordinary integral. These solutions represent lowest order solutions of an asymptotic expansion of the MHD equations for small electric field and weak time dependence. Applications to the magnetotail configuration are presented, which include the following properties in a self-consistent way: Flaring of the tail in y and z, associated with the presence of B_y and B_z; variation of plasma sheet and current sheet thickness with x and y, associated with variations of B_z; field-aligned currents at the boundary between plasma sheet and lobes with the signature of "region 1" currents, i.e., toward the Earth on the dawn side and away on the dusk side, associated with the decrease of the tail flaring with distance from the Earth; net cross-tail magnetic field. Particular steady models with field-aligned flow demonstrate the important role of the flow in allowing or producing configurations with a transition from a thick closed plasma sheet to a much thinner distant open current sheet and for the possibility of thick plasmoids propagating in near equilibrium through the thin distant current sheet.

51940 (TRITA-EPP–89-06) **Electric fields in the magnetosphere.** Faelthammar, C.G. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics. Dec 1989. 41p. (CONF-891182–: International conference on plasma physics, New Delhi (India), 22-28 Nov 1989). Order Number DE91604155. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The electric field plays an important role in the complex plasma system called the magnetosphere. In spite of this, direct measurement of this quantity are still scarce except in its lowest-altitude part, i.e. the ionosphere. The large scale ionospheric electric field has been determined from measurement on the ground and in low satellite orbit. For most of the magnetosphere, our concepts of the electric field have mostly been based on theoretical considerations and extrapolations of the ionspheric electric field. Direct, in situ, electric field measurements in the outer parts of the magnetosphere have been made only relatively recently. A few satellite missions. most recently the Viking mission, have extended the direct empirical knowledge so as to include major parts of the magnetosphere. These measurements have revealed a number of unexpected features. The actual electric field has been found to have unexpectedly strong space and time variations, which reflect the dynamic nature of the system. Examples are give of measured electric fields in the plasmasphere, the plasmasheet, the neutral sheet, the magnetotail, the flanks of the magnetosphere, the dayside magnetopause and the auroral acceleration region. (author).

51941 (TRITA-EPP–89-07) **Dynamic trapping of electrons in space plasmas.** Brenning, N.; Bohm, M.; Faelthammar, C.G. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics. Dec 1989. 36p. Order Number DE91604156. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The neutralization of positive space charge is studied in a case where heavy positive ions are added to a limited region of length L in a collisionfree magnetized plasma. It is found that electrons which become accelerated towards the positive space charge can only achieve a partial neutralization: they overshoot, and the positive region becomes surrounded by negative space charges which screen the electric field from the surroundings. The process is studied both analytically and by computer simulations with consistent results: large positive potentials ($U>>kT_e/e$) can be built up with respect to the surrounding plasma. In the process of growth, the potential maximum traps electrons in transit so that quasineutrality is maintained. The potential U is proportional to the ambient electron temperature and the square of the plasma density increase, but independent of both the ion injection rate and the length L. The process explains several features of the Porcupinge xenon beam injection experiment. It could also have importance for the electrodynamic coupling between plasmas of different densities, e.g. the injection of neutral clouds in the ionosphere of species that becomes rapidly photoionized, or penetration of dense plasma clouds from the solar wind into the magnetosphere. (31 refs.) (authors).

51942 (TRITA-EPP–89-08) **The plasma universe.** Faelthammar, C.G. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics. Dec 1989. 38p. (CONF-8912104–: 142. IAU symposium on basic plasma processes on the sun, Bangalore (India), 1-5 Dec 1989). Order Number DE91604157. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The term 'Plasma Universe', coined by Hannes Alfven, emphasices the fact that plasma phenomena discovered in the laboratory and in accessible regions of space must be important also in the rest of the universe, which consists almost entirely of matter in the plasma state. Relevant aspect of this concept will be discussed. They include the response of the plasma to electric currents, the support of magnetic-field aligned electric fields, violation of the frozen-field condition, rapid release of magnetically stored energy, acceleration of charged particles, chemical separation, and filamentary and cellular structures. (authors).

51943 (TRITA-EPP–90-03) **Potential drops supported by ion density cavities in the dynamic response of a plasma diode to an applied field.** Bohm, M.; Torven, S. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics. Jun 1990. 15p. Order Number DE91604158. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Experiments have shown that an applied voltage drop may either be supported by a cathode sheath or by a quasi-linear variation over the plasma lasting for several electron transit times. In the latter case an ion density cavity existed initially. An analytical model and numerical simulations are used to show that a cavity gives rise to a quasi-linear potential variation for applied voltage drops below a certain critical value. For larger values the drop concentrates to a cathode sheath. The quasi-linear profile steepens to a double layer for large cavity depths. (authors).

51944 **Large scale density modifications: theory and observations.** Hansen, J.D. (Physics Department, University of California at Los Angeles, Los Angeles, CA (USA)); Morales, G.J.; Duncan, L.M.; Maggs, J.E.; Dimonte, G. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 418-421 (1 Jul 1989). (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

A 2-dimensional transport code is used to investigate the self-consistent formation of large scale (several km) density depletions in the ionosphere due to HF heating under nighttime conditions. It is found that rotation of the absorption surface due to nonlinear refraction of ray trajectories near the reflection layer is an essential point in explaining the phenomena. Results obtained are in excellent agreement with observations made in the May 3-6, 1988 campaign at Areibo.

51945 **Coronal mass ejections and large geomagnetic storms.** Gosling, J.T. (Los Alamos National Lab., NM (USA)); Bame, S.J.; McComas, D.J.; Phillips, J.L. *Geophysical Research Letters (American Geophysical Union) (USA),* 17(7): 901-904 (Jun 1990).

Previous work indicates that coronal mass ejection (CME) events in the solar wind at 1 AU can be identified by the presence of a flux of counterstreaming solar wind halo electrons (above about 80 eV). Using this technique to identify CMEs in 1 AU plasma data, the authors find that most large geomagnetic storms during the interval surrounding the last solar maximum (Aug. 1978-Oct. 1982) were associated with Earth-passage of interplanetary disturbances

in which the Earth encountered both a shock and the CME driving the shock. However, only about one CME in six encountered by Earth was effective in causing a large geomagnetic storm. Slow CMEs which did not interact strongly with the ambient solar wind ahead were particularly ineffective in a geomagnetic sense.

51946 **The lower hybrid drift instability at the magnetopause.** Gary, S.P. (Los Alamos National Lab., NM (USA)); Sgro, A.G. *Geophysical Research Letters (American Geophysical Union) (USA)*, 17(7): 909-912 (Jun 1990).

When the interplanetary magnetic field is northward, wave-particle cross-field transport may contribute to solar wind-magnetosphere coupling. Such transport is studied here through the use of hybrid computer simulations (particle ions, fluid electrons with nonzero mass) carried out in the x-y plane of plasma with a density gradient in the x direction, no average flow speed, and a magnetic field B = B(x)$\hat{z}$. At early times, the lower hybrid drift instability grows on the plasma gradient. However, at times long compared to an ion gyroperiod, the fluctuations coalesce to longer wavelengths in the y-direction and nondiffusive density x-profiles emerge which exhibit plateaus and inclusions qualitatively similar to those observed by ISEE near the magnetopause. These results call into question critical assumptions of quasilinear theories of cross-field transport by this instability.

51947 (AD-A-223702/2/XAB) **High-current-density thermionic cathodes and the generation of high-voltage electron beams. Final technical report, 1 September 1982-30 April 1989.** Herniter, M.E.; Lipscomb, G.; Pearce, K.D. Michigan Univ., Ann Arbor, MI (USA). Dept. of Electrical Engineering and Computer Science. 30 Apr 1989. 53p. Contract N00014-82-K-0448. Source: NTIS, PC A04/MF A01.

The project entitled High-Current-Density Thermionic Cathodes and High Voltage Electron Beams From Thermionic Cathodes is aimed at developing a thermionic cathode of high current density for use intense electron-beam generators. The emitting material under study is lanthanum hexaboride (LaB6). The project breaks down into 3 major parts: development of methods for heating LaB6 disks to the emission-temperature range of 1800°C; measurement of the emission-current distribution over the cathode surface and correlation with thermionic-emission theory; and design and testing of an electron-gun diode with an LaB6 cathode which would be a prototype for use in an intense beam generator.

51948 (CBPF-MO-001/89, pp. 133-149) **On the measurements of molecular similarity: a connection between quantum chemistry and artificial intelligence.** Carbo, R. (Girona Col.legi Univ. (Spain). Div. de Ciencies); Calabuig, B. Centro Brasileiro de Pesquisas Fisicas (CBPF), Rio de Janeiro, RJ (Brazil). 1988. (In Portuguese). (CONF-8809499–: 6. Source: Available from the Library of the Comissao Nacional de Energia Nuclear, RJ, Brazil.

Molecular similarity measures within the quantum concept of density functions are described and analyzed. It is intended to show how artificial intelligence techniques can be used within the framework of quantum theory, in order to study and classify the molecular structures and their properties. (A.C.A.S).

51949 (CONF-900926–3) **Picosecond multiphoton ionization of atomic and molecular clusters.** Miller, J.C.; Smith, D.B. Oak Ridge National Lab., TN (USA). [1990]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 5. international conference on multiphoton processes; Paris (France); 24-28 Sep 1990. Order Number DE91000641. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

High peak-power picosecond laser pulses have been used for the first time to effect nonresonant or resonant multiphoton ionization (MPI) of clusters generated in a supersonic nozzle expansion. The resulting ions are subsequently detected and characterized by time-of-flight mass spectroscopy. Specifically, we present results involving MPI of clusters of xenon and nitric oxide. Previous MPI studies of many molecular clusters using nanosecond lasers have not been successful in observing the parent ion, presumably due to fast dissociation channels. It is proposed that the present technique is a new and rather general ionization source for cluster studies which is complementary to electron impact but may, in addition, provide unique spectroscopic or dynamical information. 23 refs., 5 figs.

51950 (CONF-901116–10) **Photodetachment of metastable He^-.** Thompson, J.S. (Tennessee Univ., Knoxville, TN (USA). Dept. of Physics); Dellwo, J.; Pegg, D.J.; Compton, R.N.; Alton, G.D. Oak Ridge National Lab., TN (USA). [1990]. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 11. international conference on the application of accelerators in research and industry; Denton, TX (USA); 5-8 Nov 1990. Order Number DE91000706. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A crossed-beams apparatus has been used to measure angular distributions and cross sections for photoelectron detachment from metastable He^-. Energy- and angle-resolved electron spectroscopy was used to investigate the spectral dependences of the angular distribution of the photoelectrons. The angular distributions along with photoelectron yield measurements were used to determine the cross sections for photodetachment of He^- (2^4P) via the energy resolved He(2^3P) and He(2^3S) exit channels. The precision of the cross section measurements was enhanced by exploiting the kinematic effects associated with detachment from a fast beam source. Calculated cross sections for the photodetachment of H^- were used to establish an absolute scale for the He^- cross section measurements.

51951 (CONF-9009261–1) **Newly appreciated roles for electrons in ion-atom collisions.** Sellin, I.A. (Tennessee Univ., Knoxville, TN (USA). Dept. of Physics and Astronomy). Oak Ridge National Lab., TN (USA). [1990]. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Workshop on fast ion collisions; Debrecen (Hungary); 17-19 Sep 1990. Order Number DE91000555. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Since the previous Debrecen workshop on High-Energy Ion-Atom Collisions there have been numerous experiments and substantial theoretical developments in the fields of fast ion-atom and ion-solid collisions concerned with explicating the previously largely underappreciated role of electrons as ionizing and exciting agents in such collisions. Examples to be discussed include the double electron ionization problem in He; transfer ionization by protons in He; double excitation in He; backward scattering of electrons in He; the role of electron-electron interaction in determining beta parameters for ELC; projectile K ionization by target electrons; electron spin exchange in transfer excitation; electron impact ionization in crystal channels; resonant coherent excitation in crystal channels; excitation and dielectronic recombination in crystal channels; resonant transfer and excitation; the similarity of recoil ion spectra observed in coincidence with electron capture vs. electron loss; and new research on ion-atom collisions at relativistic energies.

51952 (CONF-9009267–1) **Radiation interactions in high-pressure gases.** Christophorou, L.G. (Oak Ridge National Lab., TN (USA)). Oak Ridge National Lab., TN (USA); Tennessee Univ., Knoxville, TN (USA). [1990]. 81p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. This article is on basic radiation interaction processes in dense fluids and on interphase studies aiming at the interfacing of knowledge on radiation interaction processes in the gaseous and the

liquid state of matter. It is specifically focused on the effect of the density and nature of the medium on electron production in irradiated fluids and on the state, energy, transport, and attachment of slow excess electrons in dense fluids especially dielectric liquids which possess excess-electron conduction bands ($V_0 < 0$ eV). Studies over the past two decades have shown that the interactions of low-energy electrons with molecules embedded in dense media depend not only on the molecules themselves and their internal state of excitation, but also on the electron state and energy in – and the nature and density of – the medium in which the interactions occur.

This research program was started in 1984, with an initial focus on developing a powerful new method for obtaining highly detailed information on resonance-line excitation, using Na as a first test case. Although part of the apparatus needed for the required two dye lasers was in place, we otherwise started with an "empty laboratory." This experiment was completed at the end of 1988, although continuing analysis and preparing publications continued to the end of 1989. Our original proposal, as well as the 1987 renewal proposal, described our intention to then adapt this apparatus to three types of electron-atom excitation experiments. These are: multiply differential cross sections for other resonance-lines such as Li, metastable state excitation cross sections, such as Ca 4^3P and 3^3D, resonances in the excitation of weakly-bound states. It is still our intention to study these three areas, so this proposal is largely a reiteration of our 1987 proposal. However, I will emphasize here why these are important and the rationale behind the order in which we propose to attack these three subjects. As will be described, the proposed order has evolved due to laser developments within the last several years.

The major 1989 efforts have been on two aspects of experiments at TRIUMF. One effort was production of muonic hydrogen and muonic deuterium into a vacuum. We study rates relevant to muonic catalyzed fusion, and if there are found an adequate number of muons in the 2s state then we plan to measure precision energies. The second effort was to develop plans for kaonic atoms at the kaon factory. We also completed analyses from the experiments with pionic atoms at LAMPF.

51955 (GSI–90-33(prepr.)) **Correlated e^+e^- peaks observed in heavy-ion collisions.** Saiabura, P. (Frankfurt Univ. (Germany, F.R.)); Bethge, K.; Sakaguchi, K.; Stiebing, K.E.; Backe, H.; Cowan, T.E.; Greenberg, J.S.; Schweppe, J.; Schwalm, D.; Bokemeyer, H.; Folger, H. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Jul 1990. 13p. Contract BMFT 06HD133I;BMFT 06OF113;DE-AC02-76ER03074;DE-AC03-76 Source: Available from Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.).

Three very narrow e^+e^- sum-energy peaks around 610, 750, and 810 keV have been observed in U+Th as well as in U+Ta collisions at beam energies around the Coulomb barrier. As no processes involving conventional atomic and nuclear physics were found to describe their origin, the data were in particular confronted with the hypothesis that the lines are due to the two-body decay of neutral objects in an e^+e^- pair. Although the 810 keV sum-energy line observed in U+Th is consistent with the prompt two-body e^+e^- decay of a neutral object if created nearly at rest in the heavy-ion center-of-mass system, the other lines require at least a considerably more complicated scenario if they are to be explained in the context of a two-body decay. (orig.).

51956 (GSI–90-38(prepr.)) **Interchannel interactions in high-energetic radiationless transitions of neon-like ions.** Fritzsche, S. (Technische Univ., Dresden (German Democratic Republic). Inst. fuer Angewandte Kernphysik); Zschornack, G.; Musiol, G.; Soff, G. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Jul 1990. 15p. Order Number DE91706314. Source: NTIS (US Sales Only), PC A03/MF A01.

Relativistic K-LL Auger transition rates in intermediate coupling including interchannel interactions are presented for nine ions in the neon-isoelectronic sequence up to uranium. For neutral neon a comparison with experimental data is given. We demonstrate for the first time, that intercontinuum interactions result in a remarkable redistribution of individual transition rates even in high-energetic transitions. For instance, channel mixing shifts the $K\text{-}L_1L_1$ rate by about 4% and the $K\text{-}L_3L_3$ ($J = 0$) rate by about 11% in neon-like uranium, while total Auger rates are almost not affected. (orig.).

51957 (INS–830) **Sensitivity of deeply bound pionic atoms on the neutron skin.** Toki, H. (Tokyo Metropolitan Univ. (Japan). Dept. of Physics); Hirenzaki, S.; Yamazaki, T. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jun 1990. 11p. Order Number DE91712983. Source: NTIS (US Sales Only), PC A03/MF A01.

Theoretical study is given to see how the properties of deeply bound pionic atoms depend on the neutron skin. With increased neutron skin, the strong isovector part of the pion-nucleus optical potential helps develop a repulsive bump at the nuclear surface which pushes further out the pionic wave function and decreases the binding energy. With further increase of the neutron skin, the repulsive potential in the central part is reduced and an inner component of the wave function develops in the nuclear interior, and ultimately a pion bound sate of broad width is formed in the deep interior $R_n - R_p \geq 0.35$ fm. (author).

51958 (LAFI–147) **Hydrogen atom in a strong uniform electric field.** Damburg, R.Ya. AN Latvijskoj SSR, Riga (USSR). Inst. Fiziki. 1989. 28p. Order Number DE91602806. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

It has been shown that notwithstanding the separability of the Schroedinger equation for the Lo-Surdo$_s$tark (LS-S) problem for hydrogen, the quasistationary states cannot be always characterized by parabolic quantum numbers of n_1, n_2,m. It is a reason why any numerical procedure of the calculation of the LS-S parameters E_0 and Γ which ignores this circumstance can appear to be invalid for large values of n_1 and F and small ones of n_2 and m. Experimental data on the photoionization of atoms in the presence of an electric field in the vicinity of the Rydberg series limit E=0 are in an accord with theoretical predictions. 32 refs.; 6 figs.

51959 (LA-UR–90-3133) **Intensity dependent Thomson scattering and harmonic generation from free electrons.** Schappert, G.T. Los Alamos National Lab., NM (USA). [1990]. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-900926–2: 5. international conference on multiphoton processes, Paris (France), 24-28 Sep 1990). Order Number DE91000236. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In the three sections of this paper we will discuss the electron motion in an intense laser field, the radiation produced by this motion, and finally some issues involved in experiments to observe the harmonics and their frequency shifts.

51960 (LA-UR–90-3210) **Measurement of the absolute cross section for multiphoton ionization of atomic hydrogen at 248 nm.** Kyrala, G.A.; Nichols, T.D. Los Alamos National Lab., NM (USA). [1990]. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-900926–1: 5. international conference on multiphoton processes, Paris (France), 24-28 Sep 1990). Order Number DE91000222. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We present measurements of the absolute rates for multiphoton ionization of the ground state from atomic hydrogen by a linearly polarized, subpicosecond KrF laser pulse at a wavelength of 248 nm. A laser crossed atomic beam technique is used. The irradiance was varied from 3×10^{12} w/cm^2 to 2×10^{14} w/cm^2 and three above threshold ionization peaks were observed. The measured

rate for total electron production is less than predicted by the numerical and perturbation calculations, but significantly higher than calculated by the Reiss and Keldysh methods. 21 refs., 7 figs.

51961 (LBL–26455, pp. 51) **Heat-capacity measurements of submonolayer ^{4}He films adsorbed on sapphire.** Kenny, W.; Richards, P.L. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

The authors have built a novel microcalorimeter for studies of the heat capacity of submonolayers and multilayers physisorbed on a variety of substrates. The authors have completed a series of measurements of the heat capacity of ^{4}He submonolayers adsorbed on the optically polished, chemically cleaned sapphire. This study is of practical importance to the operation of composite infrared bolometers that are similar in construction to the calorimeter. The temperature dependence of the heat capacity for three different coverages of ^{4}He has been measured. The heat capacity has a temperature-dependent component that is the same for all coverages investigated, and a temperature-independent component that increases with coverage. One interpretation is that the temperature-dependent component is due to the solidification of ^{4}He near impurities on the surface, and that the temperature-independent component is due to a dilute gas phase that occupies the rest of the surface. The sharp decreases in heat capacity above 3.3 K are due to desorption of ^{4}He from the calorimeter. Measurements of the heat capacity of ^{4}He submonolayers adsorbed on Ag films are currently under way. This investigation has already shown that ^{4}He submonolayers on Ag exist in a two-dimensional gas phase between 2.3 and 3.5K. The current series of measurements, which have been extended down to 1.8 K through improvements in the apparatus, will explore the expected deviations from the two-dimensional gas-phase behavior that arise due to either second-virial-coefficient corrections to the ideal-gas law or the formation of two-dimensional solid phases.

51962 (LUNFD6-NFFK–1001-1-30-1990) **Angular correlations and fragmentation in intermediate energy heavy ion collisions.** Kristiansson, Anders. Lund Univ. (Sweden). Dept. of Cosmic and Subatomic Physics. May 1990. 34p. Order Number DE91602812. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Intermediate energy heavy-ion collisions have been studied from 35 A MeV up to 94 A MeV at various accelerators. Angular correlations between light particles and detection of projectile- and target-fragments have been used to investigate the reaction mechanisms in this transition region between low- and high energy. An excess of correlations is observed in the particle-particle elastic scattering plane. This excess increases with particle mass and can be understood in terms of momentum conservation. The fragmentation measurements gives an indication that both energy and momentum transfer to the spectator volumes does occur. (author).

51963 (ORNL/FTR–3764) **[Physics and chemistry of van der Waals particles]: Foreign trip report, August 27, 1990–September 21, 1990.** Klots, C.E. Oak Ridge National Lab., TN (USA). 8 Oct 1990. 6p. Accounts are given of the two major international conferences on the physics and chemistry of small particles, commonly referred to as van der Waals particles. Details of special interest to Oak Ridge National Laboratory personnel are cited. Information exchanges at Freiburg and Paris are described.

51964 (UCRL-CR–106064) **K-shell and L-shell plasma spectroscopy experiments: Final technical report.** Charatis, G. (KMS Fusion, Inc., Ann Arbor, MI (USA)). Lawrence Livermore National Lab., CA (USA); KMS Fusion, Inc., Ann Arbor, MI (USA). Oct 1990. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE91000950. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Detailed atomic level populations in high temperature and dense plasmas have become increasingly important in laser generated plasmas. Certain spectral line intensity ratios are density-dependent while others are temperature-dependent. Both can be used to extract information concerning population kinetics and ion level populations. In order to be useful these dependencies must be characterized by independent means. In laser produced plasmas this can be done via holographic interferometry for electron density determinations and via the slope of the H-like free-bound continuum of K-shell lines for electron temperature determinations. The characterization of density- and temperature-dependent L-shell lines can be accomplished in ionization balance experiments in which laser irradiance is varied on targets which contain both K-shell and L-shell emitters. The K-shell free-bound continua provide the local temperature determination while holographic interferometry yields density profile information, from which the temperature and density dependent L-shell lines can be characterized. This paper discusses these concepts.

51965 (UCRL-ID–104990) **Design and operation of the electron beam ion trap.** Vogel, D. Lawrence Livermore National Lab., CA (USA). 30 May 1990. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE91000074. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report describes the basic features and operating principles of the Electron Beam Ion Trap. The differences between EBIT and other sources of highly charged ions are outlined. Its features and operating parameters are discussed. The report also explains why certain design choices were necessary and the constraints involved in building an electron beam ion trap. EBIT's evaporation cooling system is described in detail. 13 refs., 8 figs.

51966 **High energy and heavy ion beams in materials analysis.** Tesmer, J.R. (Los Alamos National Lab., Los Alamos, NM (US)); Maggiore, C.J.; Nastasi, M.; Barbour, J.C.; Mayer, J.W. 290p. Materials Research Society, Pittsburgh, PA (USA) (1990). (CONF-8906186–: Materials Research Society high energy and heavy ion beams in materials analysis workshop, Albuquerque, NM (USA), 14-16 Jun 1989).

There is an increasing availability of a wider variety of beams and energies to materials scientists - provided by modern small electrostatic accelerators and the accelerators formerly used for nuclear physics research. In addition, elastic recoil detection which uses both higher energies and heavy ions has not been well documented in any one place. The low energy arena of ion beam materials analysis is well known. To extend the applicability of these techniques, both nuclear theory and data must be carefully revisited. Progress in both these areas is described in these proceedings as well as the needs for future work.

51967 **Measured radiative lifetimes for H_2 and HD in the E,F $^1\Sigma_g^+$ electronic state.** Chander, D.W. (U.S. Dept. of Energy, Offices of Basic Energy Sciences, Div. of Chemical Sciences (US)); Thorne, L.R. pp. MF1 of Proceedings of the forty-first symposium on molecular spectroscopy. The Ohio State University, Columbus, OH (USA) (1986). pp. 166 (CONF-8606172–: 41. symposium on molecular spectroscopy, Columbus, OH (USA), 16-20 Jun 1986).

R86000539.

This paper discusses the use of tunable, pulsed ultraviolet laser radiation to prepare H_2 and HD in selected rovibronic levels of the E,F $^1\Sigma^+$ electronic state. This state is accessible from the ground state, X $^1\Sigma_g^{+g}$, by means of two-photon excitation. Subsequent absorption of near infrared laser radiation by molecules prepared in the E,F $^1\Sigma_g^+$ state produces ions that are detected by a time-of-flight mass spectrometer. Radiative lifetimes of individual rovibronic levels are determined by measuring the ion signal as a function of the time delay between the ultraviolet and near-infrared laser pulses. A decreasing exponential function is fit to the ion signal associated with a particular level to obtain its lifetime. The authors report that measured lifetimes are in good agreement with previously reported theoretical lifetimes.

51968 **Rotational analysis of some vibronic bands in the $^3A_u \leftarrow {}^1A_g$ transition of Glyoxal: Spin splittings in the lowest triplet state of the isolated molecule.** Spangler, L.H. (Los Alamos National Lab., NM (USA)); Pratt, D.W.; Birss, F.W. pp. TC2 of Proceedings of the forty-first symposium on molecular spectroscopy. The Ohio State University, Columbus, OH (USA) (1986). pp. 166 (CONF-8606172–: 41. symposium on molecular spectroscopy, Columbus, OH (USA), 16-20 Jun 1986).

R86000539.

This paper discusses a rotational analysis of three vibronic bands (0_0^0, 7_0^2, and 5_0^1) in the laser-induced phosphorescence spectrum of glyoxal (CHO-CHO) which has been performed. From this analysis the authors deduce the rotational, spin-rotation, and spin-spin (plus spin-orbit) constants of the lowest triplet state of the isolated molecule. ^3A_u Glyoxal has been shown to exist in nearly the same trans-planar (C_{2h}) configuration as the lowest excited singlet state. Both geometries are very similar to that of the ground state. The dynamic implications of these structural findings are discussed. The authors compare the spin splittings determined in this work with those previously measured in the condensed phase, using optically detected magnetic resonance methods.

51969 Laser-induced phosphorescence spectroscopy in supersonic jets: The lowest triplet states of glyoxal, methylglyoxal, and biacetyl. Spangler, L.H. (Los Alamos National Lab., NM (USA)); Pratt, D.W. pp. TC1 of Proceedings of the forty-first symposium on molecular spectroscopy. The Ohio State University, Columbus, OH (USA) (1986). pp. 166 (CONF-8606172–: 41. symposium on molecular spectroscopy, Columbus, OH (USA), 16-20 Jun 1986).

R86000539.

This paper reports the first structural study of the lowest triplet states of three α-dicarbonyls (glyoxal, methylglyoxal, and biacetyl) using the technique of laser-induced phosphorescence (LIP) spectroscopy in supersonic jets. The authors state that the 0_0^0 band is the strongest band in the LIP spectrum of glyoxal, but the $T_1 \leftarrow S_0$ transitions of methylglyoxal and biacetyl each exhibit strong progressions in the torsional vibrations of the methyl groups, showing that these molecules undergo a conformational change of excitation to the lowest triplet state. A Franck–Condon analysis of the methylglyoxal spectrum, with proper consideration for nuclear spin statistics, yields a methyl barrier of $V_3 = 115 \pm 5$ cm^{-1} in this state. This value has been confirmed by a direct measurement of the tunneling splitting of A and E torsional levels. The hindering potential in the lowest triplet state of methylglyoxal is substantially different from those in the ground ($V_3 = 269$ cm^{-1}) and first excited singlet ($V_3 = 190$ cm^{-1}) states. Possible reasons for these differences are discussed.

51970 Electronic structure of heavy-atom molecules. Pitzer, R.M. (Ohio State Univ., Columbus, OH (USA). Dept. of Chemistry); Winter, N.W. pp. RA6 of Proceedings of the forty-first symposium on molecular spectroscopy. The Ohio State University, Columbus, OH (USA) (1986). pp. 166 (CONF-8606172–: 41. symposium on molecular spectroscopy, Columbus, OH (USA), 16-20 Jun 1986).

R86000539.

This paper discusses the use of effective core potentials and spin-orbit operators derived from relativistic atomic calculations in treating the electronic structure of molecules containing heavy atoms. The authors present computer programs both to evaluate integrals of the spin-orbit operator over Gaussian atomic orbitals and to transform them to integrals over molecular orbitals for polyatomic molecules. Results are given.

51971 Infrared rotational spectrum of $\tilde{X}\ ^3B_1$ CH_2 around 400 cm^{-1}. Sears, T.J. (Brookhaven National Lab., Upton, NY (USA). Chemistry Dept.). pp. TE1 of Proceedings of the forty-first symposium on molecular spectroscopy. The Ohio State University, Columbus, OH (USA) (1986). pp. 166 DOE Contract AC02-76CH00016. (CONF-8606172–: 41. symposium on molecular spectroscopy, Columbus, OH (USA), 16-20 Jun 1986).

R86000539.

This paper discusses pure rotational transitions in the methylene radical that have been detected at infrared wavelengths. The radical was generated in a discharge in a dilute mixture of ketene (CH_2CO) in helium and the transitions detected at Doppler limited resolution by diode laser absorption. The author states that so far, only transitions in the ground vibrational level have been detected, however the signal to noise is such that similar rotational transitions in the (010) level should also be detectable. The rotational levels involved ($K_a = 3,4$) are much higher in energy than any previously observed and their positions will enable further refinement of the $CH_2\tilde{X}^3B_1$ potential function. The study also demonstrates the utility of long wavelength infrared laser spectroscopy for detecting rotational spectra of light molecules and transitions between high rotational levels of the CH radical have also been detected with extremely high signal/noise.

51972 Calculated proton-induced thick-target neutron and radionuclide yields for $E_p \leq 100$ MeV. Wilson, W.B. (Los Alamos National Lab., Los Alamos, NM (US)); Arthur, E.D.; Bozoian, M.; Perry, R.T.; Young, P.G. pp. 39-50 of High energy and heavy ion beams in materials analysis. Tesmer, J.R.; Maggiore, C.J.; Nastasi, M.; Barbour, J.C.; Mayer, J.W. Materials Research Society, Pittsburgh, PA (USA) (1990). pp. 290 (CONF-8906186–: Materials Research Society high energy and heavy ion beams in materials analysis workshop, Albuquerque, NM (USA), 14-16 Jun 1989).

Earlier proton-induced thick-target yield calculations have been extended in proton energy range and to additional target elements, using the proton stopping cross section data of Anderson and Ziegler and cross sections modeled with the GNASH code. The targets described include Be, C, O, Ne, Al, Si, Fe, Co, Ni, Cu, W, Pb and Bi. Thick- target yields are presented for these thirteen targets, with most extending to 100 MeV.

51973 Hydrogen and deuterium profiling in polymers using light and heavy ion elastic recoil detection. Green, P.F. (Sandia National Lab., Albuquerque, NM (US)); Doyle, B.L. pp. 87-102 of High energy and heavy ion beams in materials analysis. Tesmer, J.R.; Maggiore, C.J.; Nastasi, M.; Barbour, J.C.; Mayer, J.W. Materials Research Society, Pittsburgh, PA (USA) (1990). pp. 290 (CONF-8906186–: Materials Research Society high energy and heavy ion beams in materials analysis workshop, Albuquerque, NM (USA), 14-16 Jun 1989).

Silicon and helium elastic recoil detection (ERD) have been used to obtain concentration versus depth profiles of hydrogen (^1H) and deuterium (^2H) in polymers. Using helium ERD, a depth resolution of 100nm was achieved in polystyrene, whereas 30 nm was achieved using silicon ERD. Polymers are in general susceptible to radiation damage and precautions are necessary in order to minimize this. These precautions are addressed. When helium ERD is used to obtain the yield versus energy profile, the conversion of this profile to one of concentration versus depth is relatively straightforward since the scattering cross sections for collisions between helium and ^1H or ^2H nuclei are independent of energy over typical incident energy ranges (2.3 - 3.0 MeV) used in these studies. With the use of silicon ions, corrections for the energy dependence of the scattering cross section must also be made. A comparison of helium ERD measurements of diffusion in polymer systems is made with those obtained using other techniques.

51974 Calculated γ induced thick-target neutron and radionuclide yields for $E_\alpha \leq 50$ MeV. Bozoian, M. (Los Alamos National Lab., Los Alamos, NM (US)); Perry, R.T.; Wilson, W.B. pp. 51-60 of High energy and heavy ion beams in materials analysis. Tesmer, J.R.; Maggiore, C.J.; Nastasi, M.; Barbour, J.C.; Mayer, J.W. Materials Research Society, Pittsburgh, PA (USA) (1990). pp. 290 (CONF-8906186–: Materials Research Society high energy and heavy ion beams in materials analysis workshop, Albuquerque, NM (USA), 14-16 Jun 1989).

Thick-target yields for αs incident on elements $4 \leq Z \leq 15$ and $Z = 17$ have been calculated using the α stopping data of Ziegler with radionuclide production cross sections calculated with the GNASH code. Comparisons are made of the calculated cross sections with sparse measured data. Radionuclide production yields are tabulated at 5, 10, 20, 30, 40 and 50 MeV.

51975 A comparison of long distance electron and energy transfer. Closs, G.L. (Chicago Univ., IL (USA). Dept. of Chemistry); Piotrowiak, P.; Miller, J.R. pp. 23-31 of Photochemical energy conversion. Norris, J.R.; Meisel, D. Elsevier Science Pub. Co., Inc., New York, NY (USA) (1989). pp. 364 (CONF-880767–: 7. international conference on photochemical conversion and storage of solar energy, Evanston, IL (USA), 31 Jul - 5 aug 1988).

This paper compares intramolecular long distance electron transfer (ET) and triplet energy transfer (TT using two similar series of model compounds in which the donor and acceptor distance is varied in an identical way by employing common rigid spacer groups with identical stereochemical attachments in both series. It is found

that transfer rates in the two series are correlated in a quantitative way. The results support a simple model which views TT as a simultaneous two-electron two-site exchange. The model is discussed in terms of the corresponding HOMO and LUMO overlap integrals.

51976 **Modeling of femtosecond laser-plasma interactions: Unsafe at any speed.** Rosen, M.D. (Lawrence Livermore National Lab., CA (USA)). pp. 66 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324–: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

The authors describe the sue of large hydrodynamic/atomic physics simulation codes to model the radiative yields of various Z targets irradiated by high power femtosecond pulses.

51977 **Simulations of intense laser beams interacting with gases and solids.** Olson, G.L. (Computational Physics Group, Los Alamos National Lab., Los Alamos, NM (US)). pp. 75 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324–: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

The Los Alamos Bright Source Lasers (LABS I and II) are discussed. LABS I generates subpicosecond pulses of 5 eV photons with peak intensities of a few 10^{17} W/cm$_2$, while LABS II operates with shorter pulses at 4 eV and reaches intensities one order of magnitude higher. These lasers have been focused onto gas and solid targets. The purpose of this paper is to discuss numerical simulations of these experiments.

51978 **Multiphoton ionization rates for atomic hydrogen: Solutions of Schrodinger equation compared with model values.** LaGattuta, K.J. (Los Alamos National Lab., NM (USA)). pp. 79 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324–: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

Direct solutions of the time-dependent Schrodinger equation, for an electron moving in three spatial dimensions (3D), bound initially ($t \leq 0$) by Coulomb potential, and acted upon by an extrinsic oscillating electric field, have been described recently. The oscillating electric field models the effect of an incident laser beam on the initially bound electron. Such solutions being rather difficult to obtain, the region of laser parameter space (I_0, ω_0) and range of electron binding energies (E_B) which has been considered to-date is very limited, at least for real 3D Coulomb potentials. Consequently, the accuracy of the oft-cited KRF model photoionization rates is still generally open to question. The authors describe the results of calculations of photoionization rates for atomic hydrogen initially in its ground state, and acted upon by a laser with a linearly polarized electric field, and with a photon energy ω_0 = 5 eV. Experiments with such a laser, and for neutral hydrogen targets, are underway. Comparison of computed rates is made with the Reiss formula and with the cycle average field ionization rate. Neither of these model rates being satisfactory, two new formulas are proposed.

51979 **Spectral shifting of intense femtosecond pulses during strong field ionization and plasma recombination.** Downer, M.C. (Texas Univ., Austin, TX (USA). Dept. of Physics); Wood, W.M.; Banyai, W.M.; Trisnadi, J. pp. 12 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324–: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

Highly amplified femtosecond pulses permit the study of atomic ionization in superintense light fields on a time scale shorter than the escape time of electrons from the interaction region or the recombination of ionized species. Most recent studies of strong field femtosecond ionization have utilized photoelectron spectroscopy at low gas pressures ($\sim 10^{-7}$ torr). The authors utilize a complementary experimental method with unique capabilities, namely the spectral blue shift which is caused by the ultrafast refractive index decrease which occurs when a plasma is created within 1 or 20 optical cycles during the pulse. Accurate analysis of such blue shifts requires modelling based on ionization rates calculated from a Keldysh theory. Because of the ultrashort pulse duration (<90 fs.), Atomic collisions and plasma expansion play no role, compared to experiments with picosecond and longer pulses. Moreover, the authors have shown that in a sufficiently tight focus geometry, contributions from non-ionizing χ processes (e.g. white light continuum generation, self focusing), which cause both red and blue shifts, are suppressed relative to plasma generation effects. Thus detailed observation of blue shift provides a clean diagnostic of strong field ionization which complements photoelectron spectroscopy in testing theories of superintense laser-atom interactions.

51980 **Can optical lasers interact with atomic nuclei.** Weiss, M.S. (Lawrence Livermore National Lab., CA (USA). Physics Dept.). pp. 3 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324–: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

The interaction of optical lasers with atomic nuclei through electron motion is calculated semiclassically and quantum mechanically. Experimental tests are proposed.

51981 **3D particle simulation on interaction of ultrashort laser pulse with solid density hydrogen plasma.** Nishihara, K. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering); Yasui, H. pp. 99 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324–: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

The interaction of very short laser pulses with matter has become an important field. If a pulse duration of a laser light is so short that no significant hydrodynamic expansion of a matter takes place, the electric field of a laser interacts directly with a solid density matter. The mean ion distance, $a \sim (3/4\pi n)^{1/3}$ is of the order of one angstrom at a solid density. The quivering distance of electrons oscillating at a laser frequency, $\delta x = eE_0 / m\omega_0^2$, exceeds the mean ion distance at a high intensity. In addition to that, the ion coupling coefficient, $\gamma = e\phi / KT = z^2 e^2 / aKT$, is of the order of one for such a high density plasma. This the oscillating electrons interact with many ions and electrons at the same time, because ions and electrons are also strongly correlated. The authors discuss how they have studied the femtosecond laser-target interaction by using the 3d two-component (electron and ion) particle code SCOPE, in which short range forces are computed by using a direct particle-particle summation over spatially localized forces and long-range forces by particle-in-cell method.

51982 **The status of SLC commissioning.** Atwood, W.B. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp. 32-39 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 DOE Contract AC03-76SF00515. (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper discusses the key issue in the arcs and final focus areas which is survey. The first attempt to thread the electron beam through some 19 columnators and many more magnetic elements in the final focus is presented.

51983 **Searching for existing nuclear data.** Tesmer, J.R. (Los Alamos National Lab., Los Alamos, NM (US)); Cokal, H.; Maggiore, C.J. pp. 197-202 of High energy and heavy ion beams in materials analysis. Tesmer, J.R.; Maggiore, C.J.; Nastasi, M.; Barbour, J.C.; Mayer, J.W. Materials Research Society, Pittsburgh, PA (USA) (1990). pp. 290 (CONF-8906186–: Materials Research Society high energy and heavy ion beams in materials analysis workshop, Albuquerque, NM (USA), 14-16 Jun 1989).

As an example of finding existing data useful for high energy and heavy ion materials analysis the Nuclear Structure References of Brookhaven National Laboratory's National Nuclear Data Center

was searched. The search was limited to incident ions of mass ≤ 7 amu (excluding alphas) with energies under 100 MeV, and the target nuclei were limited to mass ≤ 30 amu. Ease of use, time necessary for retrieval as well as pertinence was explored. Examples of applicable data found during the search are presented.

51984 Overview of σ, ρ and dσ/dt in high energy proton-antiproton scattering. Cahn, R.N. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). pp. 108-114 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

Recent results on the total cross section, real-to-imaginary ratio of the forward scattering amplitude, and the slope parameter are discussed. The ability of future Tevatron data to distinguish between alternative explanations of the large value of ρ measured by UA-4 is emphasized.

51985 Initial operation of a high-power quasi-optical gyrotron. Fliflet, A.W. (Long Pulse Electron Cyclotron Maser Section, Beam Physics Branch, Plasma Physics Div., U.S. Naval Research Lab., Washington, DC (US)); Hargreaves, T.A.; Manheimer, W.M.; Fischer, R.P.; Barsanti, M.L. *IEEE Transactions on Plasma Science (Institute of Electrical and Electronics Engineers) (USA),* 18(3): 306-312 (Jun 1990).

Results from the initial operating of a high-power quasi-optical gyrotron based on the 90-kV 50-A Varian VUW-8144 electron gun are reported. The output power and efficiency have been measured for a resonator mirror separation of 19.4 cm with a magnetic field of 4.95 T, corresponding to resonator output coupling of 1.9%, and for a resonator mirror separation of 21.4 cm with a magnetic field of 4.7 T, corresponding to a resonator output coupling of 3.1%. Operation was multimoded with 3–6 modes excited in the range of 125–130 GHz for the 4.95-T magnetic field. A peak efficiency of 15% at an output power of 161 kW was obtained for a gun voltage of 93 kV and a current of 12 A. A peak-output power of 364 kW at an efficiency of 10% was obtained at a voltage of 95.6 kV and 37.5 A.

51986 Operation of a large-orbit high-harmonic gyro-traveling-wave tube amplifier. Furuno, D.S. (Marietta ADTO, Rancho Bernardo, CA (US)); McDermott, B.D.; Kou, C.S.; Luhmann, N.C.; Vitello, P. *IEEE Transactions on Plasma Science (Institute of Electrical and Electronics Engineers) (USA),* 18(3): 313-320 (Jun 1990).

The high-harmonic gyro-traveling wave tube (gyro-TWT) is a high-power ({ >=} 1 kW) millimeter wave amplifier based on the synchronous interaction of a beam of large-orbit axis-encircling electrons with a high-order cylindrical waveguide mode. Since the interaction occurs at a high harmonic of the cyclotron frequency, the intense magnetic fields required for the conventional fundamental-mode gyro-TWT are not required. A proof-of-principle experiment designed to demonstrate the interaction of a 150-mA 350-keV electron beam with the TE_{81} ode of a cylindrical waveguide is described. Principal results include a small signal gain of 10 dB, an interaction bandwidth of 4.3 percent, and a saturated power transfer from electron beam to wave of 0.5 kW.

51987 Equilibrium and stability of free-running, phase-locked, mode-locked quasi-optical gyrotrons. Manheimer, W.M. (Physics Div., Naval Research Lab., Washington, DC (US)); Levush, B.; Antonsen, T.M. *IEEE Transactions on Plasma Science (Institute of Electrical and Electronics Engineers) (USA),* 18(3): 350-368 (Jun 1990).

Equilibria and stability (both single-mode and sideband) are calculated and contrasted for free-running, phase-locked, and mode-locked oscillator configurations in a quasi-optical gyrotron. The oscillator can be phase-locked by direct injection of radiation into the oscillator cavity. The equilibrium and stability properties are not greatly affected here at low injection power levels. Alternatively, the oscillator could be phase-locked by prebunching the beam. If the beam is prebunched, there are dramatic effects on both equilibrium and stability. The transverse efficiency can be considerably enhanced by prebunching the beam. This prebunching can be done in either a phase-locked (using an external RF source) or mode-locked (using the oscillator output) configuration. The stable locking bandwidth turns out to be about half the ω/Q linewidth of the mode.

51988 Submillimeter-wave harmonic gyrotron experiment. Spira-Hakkarainen, S. (Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center); Kreischer, K.E.; Temkin, R.J. *IEEE Transactions on Plasma Science (Institute of Electrical and Electronics Engineers) (USA),* 18(3): 334-342 (Jun 1990).

A theoretical and experimental investigation of the operation at submillimeter wavelengths of a harmonic gyrotron is reported. Using a waveguide cavity with an iris at the output end of the straight section, 14 different second-harmonic modes were observed with frequencies of 301–503 GHz, output powers of 1-22 kW, and a 12-MHz emission frequency bandwidth. The highest output power was 22 kW, with a total efficiency of 3.5% at 467 GHz, and an output power of 15 kW with a 6% efficiency was obtained at 417 GHz. Research was conducted using a 65–75 kV up to 10-A electron gun with 1–1.5 μs pulse-length and a 4-Hz repetition rate, which produced a helical electron beam in magnetic fields of up to 14 T. These results represent the first operation of a high-power harmonic gyrotron in the submillimeter region.

51989 Multimode simulations without particles in the quasi-optical gyrotron. Riyopoulos, S. (Applied Physics Div., Science Applications International Corp., McLean, VA (US)). *IEEE Transactions on Plasma Science (Institute of Electrical and Electronics Engineers) (USA),* 18(3): 369-386 (Jun 1990).

A set of coupled nonlinear differential equations, involving the slow amplitude and phase variation for each mode, is used to simulate the multimode dynamics in the quasi-optical gyrotron. The interaction among various modes is mediated by coupling coefficients of known analytic dependence on the normalized current I, the interaction length μ, and the frequency detunings Δ_j corresponding to the competing frequencies ω_j. The equations include all the possible resonant combinations of up to four different frequencies, $\omega_l - \omega_j + \omega_k - \omega_i \simeq 0$, among a set of N participating modes, keeping terms up to fifth order in the wave amplitudes. The formalism is quite general and can be used to study mode competition, the existence of a final steady state and its stability, as well as its accessibility from given initial conditions. It is shown that when $\mu/\beta_\perp \gg 1$, μ can be eliminated as an independent parameter.

51990 A particle-in-cell simulation of a cyclic beam buncher. Peratt, A.L. (Los Alamos National Lab., NM (USA)); Snell, C.M.; Felber, F.S. *IEEE Transactions on Plasma Science (Institute of Electrical and Electronics Engineers) (USA),* 18(3): 636-631 (Jun 1990).

A relatively weak TE wave in a cylindrical cavity can efficiently bunch an intense electron beam when the phase velocity of the wave is matched to the beam cyclotron frequency. Fully electromagnetic, relativistic, 2-$\frac{1}{2}$-dimensional simulations illustrate the applicability of this bunching mechanism to high-power generators.

51991 Differential, partial cross sections for electron excitation of the sodium 3P state. Han, X.L. (Joint Institute for Laboratory Astrophysics, National Institute of Standards and Technology, Boulder, CO (USA)); Schinn, G.W.; Gallagher, A. *Physical Review, A (General Physics) (USA),* 42(3): 1245-1257 (1 Aug 1990).

Using a powerful laser-based experimental method, the cross section for electron excitation of Na(3S) atoms to the Na(3P) state has been decomposed into partial components with respect to changes in the spin and angular momentum of the atomic electron, and these partial cross sections are further reduced to their differential character with respect to the electron scattering angle. Partial, differential cross sections are reported for electron collision energies from threshold 2.1 to 3.6 eV, and compared to available calculations.

51992 Double excitation of He by fast ions. Giese, J.P. (Oak Ridge National Laboratory, P.O. Box 2008, Oak Ridge, TN (USA)); Schulz, M.; Swenson, J.K.; Schoene, H.; Benhenni, M.; Varghese, S.L.; Vane, C.R.; Dittner, P.F.; Shafroth, S.M.; Datz, S. *Physical*

Review, A (General Physics) (USA), 42(3): 1231-1244 (1 Aug 1990). DOE Contract AC05-84OR21400.

Autoionization of He atoms following double excitation by electrons, protons, C^{Q+} (Q=4–6), and F^{Q+} (Q=7–9) ions has been studied. The electron-emission yields from the doubly excited $2s^2(^1S)$, $2s2p(^1P)$, and $2p^2(^1P)$ states were measured at the reduced projectile energy of 1.5 MeV/nucleon for observation angles between 10° and 60°. The results indicate excitation to the $2s^2(^1S)$ and $2p^2(^1D)$ states increases as approximately Q^3, while excitation to the $2s2p(^1P)$ state varies as approximately Q^2, where Q is the charge of the projectile. These charge dependences are significantly less than the Q^4 dependence expected in the independent-electron model, suggesting the interaction between the two target electrons is important in creating the doubly excited states.

51993 Semiclassical study of the collision of a highly excited Rydberg atom with the molecules HF and HCl. Kimura, M. (Argonne National Laboratory, Argonne, IL (USA)); Lane, N.F. *Physical Review, A (General Physics) (USA)*, 42(3): 1258-1266 (1 Aug 1990). DOE Contract W-31109-ENG-38.

The semiclassical impact-parameter method is applied to the processes of state changing and energy transfer in the collision of a highly excited Rydberg atom ($n \geq 20$) with the polar molecules HF and HCl. The relative motion of the molecule and atomic nucleus is taken to be rectilinear; the electron-molecule and ion core-molecule interactions are represented by cutoff dipole forms. Cross sections for transitions involving quantum numbers n and l of the atom and rotational quantum number j of the molecule are obtained for a range of collision energies and initial atomic and molecular states. Comparisons are made with the results of earlier classical studies and with the quantum-mechanical impulse approximation. Collision rates are calculated and compared with experimental values for l mixing and n and j changing. The agreement between experiment and theory is shown to be satisfactory, within the uncertainties of both the measurements and the theory. Cases of agreement and disagreement between various theories are examined. One finding of the present work is that the quantum-mechanical impulse approximation appears to significantly overestimate the values of various state-changing cross sections when the internal energy defect is small. The validity of the impulse approximation for collisions of Rydberg atoms with polar molecules is discussed.

51994 High-resolution photoelectron spectrometry of selected *ns'* and *nd'* autoionization resonances in Ar, Kr, and Xe. Wu, J.Z. (University of Central Florida, Orlando, Florida 32816 (USA)); Whitfield, S.B.; Caldwell, C.D.; Krause, M.O.; van der Meulen, P.; Fahlman, A. *Physical Review, A (General Physics) (USA)*, 42(3): 1350-1357 (1 Aug 1990). DOE Contract AC05-84OR21400.

Photoionization cross sections (σ) and photoelectron angular distribution parameters (β) across the (ns',nd') autoionization resonances for Ar, Kr, and Xe have been measured with photon resolution widths as low as 0.023 A by means of synchrotron-based photoelectron spectroscopy. The experimental results are compared with those obtained by other experimental techniques and theoretical results. The enhanced resolution allows a redetermination of the width of the ns' resonances.

51995 Large pressure-dependent cooperative shifts in multicolor odd-photon resonant atomic excitation. Payne, M.G. (Chemical Physics Section, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831-6378 (USA)); Garrett, W.R. *Physical Review, A (General Physics) (USA)*, 42(3): 1434-1441 (1 Aug 1990). DOE Contract AC05-84OR21400.

We show that when three-photon excitation of a dipole-allowed transition is mediated by two laser beams at angular frequencies ω_{L1} and ω_{L2} that are crossed at an angle θ, large cooperative pressure-dependent shifts occur in the line shape for resonant excitation. When excitation of the state is by a $2\omega_{L1} \pm \omega_{L2}$ process and either $\theta \ll 1$ or $\omega_{L1} \gg \omega_{L2}$, the cooperative shift is large compared with the pressure-induced width of the line. For the $2\omega_{L1}+\omega_{L2}$ case the shift is toward higher excitation energy, while for $2\omega_{L1}-\omega_{L2}$ the shift is to lower excitation energies. In cases where the resonance can be reached by more than one pathway, differing only in the directions of propagation of the photons involved in the excitation, multiple peaks are predicted in the excitation line shape.

51996 Analytic solutions for three-state systems with overlapping pulses. Carroll, C.E. (Department of Physics, St. John Fisher College, Rochester, NY (USA)); Hioe, F.T. *Physical Review, A (General Physics) (USA)*, 42(3): 1522-1531 (1 Aug 1990). DOE Contract FG02-84ER13243.

Two classes of analytic solutions for three-state systems involving two overlapping laser pulses of different shapes, or of similar shapes but with their centers displaced, are presented. We find a remarkable connection between the order of arrival of the two overlapping pulses and the effectiveness of transfer from the ground state to the third state, and we find remarkable results for the maximum occupation probability of the intermediate state. The approach of these analytic solutions to the adiabatic-following process is also demonstrated.

51997 Fluctuations in fluorescence from an ensemble of two-level atoms pumped simultaneously by a coherent and a chaotic field. Vemuri, G. (School of Physics, Georgia Institute of Technology, Atlanta, GA (USA)); Agarwal, G.S. *Physical Review, A (General Physics) (USA)*, 42(3): 1687-1692 (1 Aug 1990).

We use a recently developed model for the interaction of a two-level atom with a coherent and a chaotic field of arbitrary bandwidth to study population fluctuations induced by the chaotic pump. We report numerical results for the fluctuations in the intensity of the fluorescence and their power spectra. We also give results for the effect of field fluctuations on the macroscopic polarization produced by the atoms. We show how detuning of the laser from the resonance frequency of the atoms affects the fluctuations in the fluorescence. The fluctuation behavior is quite sensitive to the correlation time of the chaotic field.

51998 *K*-shell vacancy production by direct Coulomb ionization in 47-MeV Ca^{17+}+Ar collisions. Heber, O. (Cyclotron Institute, Texas A&M University, College Station, Texas 77843 (USA)). *Physical Review, A (General Physics) (USA)*, 42(3): 1795-1798 (1 Aug 1990).

Calculations employing the independent-electron approximation suggest that direct Coulomb ionization is the dominant mechanism for Ar K-vacancy production by 47-MeV Ca^{17+}, rather than K-K vacancy sharing as proposed by Schlachter *et al.* [J. Phys. B 21, L291 (1988)]. Using electron-capture probabilities for zero impact parameter given by the classical-trajectory Monte Carlo model, good agreement with the experimental charge-state distribution for multielectron capture in coincidence with Ar and Ca K x rays is achieved.

51999 Analytic solutions for nonsingular Coulomb potentials. Hahn, Y. (Department of Physics, University of Connecticut, Storrs, Connecticut 06269 (USA)). *Physical Review, A (General Physics) (USA)*, 42(3): 1809-1812 (1 Aug 1990).

A series of nonsingular Coulomb potentials is found that admits exact analytic solutions. The form of the potentials is $V=-Ze^2/(r+a)$ with specific choices for the cutoff parameter a, which does not have the troublesome singularity at r=0 but retains the long-range feature of the Coulomb interaction. Determination of the parameter a and construction of the analytic solutions are discussed in detail. Applications to laser-induced dressing of atomic states are considered.

52000 Calculation of rotational energy transfer rates for HD (v=1) in collisions with thermal HD. Brown, N.J. (Applied Science Division, Lawrence Berkeley Laboratory, Berkeley, California 94720 (USA)); Longuemare, M. *Journal of Chemical Physics (USA)*, 93(4): 2413-2417 (15 Aug 1990). DOE Contract AC03-76SF00098.

State resolved rotational energy transfer rates for HD+HD collisions have been computed using quasiclassical dynamics. One of the HD molecules is given an energy corresponding to v=1 and a specific rotational state, $J_1 \leq 6$. The other HD molecule is given a rotational–vibrational energy corresponding to an eigenstate of HD but selected according to a thermal distribution at 300 K. The translational energy is selected according to the appropriate thermal distribution at 300 K. The energy transfer is dominated by

translational–rotational energy exchange. The calculated rotational energy transfer rates are compared with the experiments of Chandler and Farrow. Modest agreement is achieved for $J_1 \leq 2$. Reasons for the lack of agreement are discussed.

52001 **A crossed-beam study of the state-resolved dynamics of CH($X\,^2\Pi$)+D_2. I. The inelastic scattering channel.** Macdonald, R.G. (Chemistry Division, Argonne National Laboratory, Argonne IL 60439 (USA)); Liu, K. *Journal of Chemical Physics (USA),* 93(4): 2431-2442 (15 Aug 1990). DOE Contract W-31109-ENG-38.

The state-to-state integral cross sections for the inelastic scattering of CH($X\,^2\Pi$) and D_2 to produce rotationally excited CH($X\,^2\Pi$) product have been measured in a crossed-beam apparatus by the laser-induced fluorescence method. Two types of measurements were performed: (1) the translational energy dependence of an individual quantum state of the product and (2) the state distribution of the products at fixed and well-defined translational energy. For the inelastic scattering channel, the cross sections gradually increased from a dynamical threshold to a broad maximum and then slowly decreased as the translational energy increases. Evidence for multiple-impact rotational rainbows was found and a possible frequency-locking phenomenon between the two receding rotors resulted. Moderate orbital alignment was observed except for the highest rotational levels of the product. By comparing and contrasting the kinematically similar system CH($X\,^2\Pi$)+He, the influence of a strongly attractive potential energy surface on the inelastic scattering of CH+D_2 was inferred. Combining the results of the inelastic scattering and the isotopic exchange channels (the following paper) provide an unprecedented look into the dynamics of collisions between CH($X\,^2\Pi$) and D_2.

52002 **A crossed-beam study of the state-resolved dynamics of CH($X\,^2\Pi$) + D_2. II. The isotopic exchange channel.** Macdonald, R.G. (Chemistry Division, Argonne National Laboratory, Argonne, IL 60439 (USA)); Liu, K. *Journal of Chemical Physics (USA),* 93(4): 2443-2459 (15 Aug 1990). DOE Contract W-31109-ENG-38.

The state-to-state integral cross sections for the isotopic exchange reaction of CH($X\,^2\Pi$) with D_2 to produce CD($X\,^2\Pi$) have been measured in a crossed-beam apparatus by the laser-induced fluorescence method. Two types of measurements were performed: (1) the translational energy dependence of an individual quantum state of the product and (2) the state distribution of the products at fixed and well-defined translational energy. To understand some of the finer details of the reaction dynamics similar experiments were also carried out on the reaction CD($X\,^2\Pi$) with H_2 to give CH($X\,^2\Pi$). For the isotopic exchange channel, the cross section decreased rapidly with increasing translational energy, signifying a complex formation reaction mechanism. The CD(CH) product rotational level distributions are substantially colder than a statistical expectation and are interpreted as the result of a multiple-impact collision between the receding products in the exit channel. A novel frequency-locking mechanism, similar to that proposed to understand the dynamics of inelastic collisions between CH and D_2 (the preceding paper), is suggested to explain anomalous peaks in the product rotational level distribution for the isotopic exchange channel. However, the fine-structure state distributions for the reactive process, which are very different from that for the inelastic channel, cannot be rationalized by conventional interpretation. Some basic concepts about fine-structure selectivity in chemical reactions have been developed. With these concepts, it is conjectured that the fine-structure state distributions of open-shell molecules arising from reactive encounters could provide a "fingerprint" of the electronic wave function at the transition state.

52003 **Gaussian-1 theory of molecular energies for second-row compounds.** Curtiss, L.A. (Chemical Technology Division/Materials Science Division, Argonne National Laboratory, Argonne, IL (USA)); Jones, C.; Trucks, G.W.; Raghavachari, K.; Pople, J.A. *Journal of Chemical Physics (USA),* 93(4): 2537-2545 (15 Aug 1990). DOE Contract W-31109-ENG-38.

The Gaussian-1 theoretical procedure is extended and tested on compounds containing second-row atoms (Na–Cl). This is a composite procedure based on *ab initio* molecular orbital theory, utilizing large basis sets (including diffuse-*sp*, double-*d*, and *f*-polarization functions) and treating electron correlation by Moller–Plesset perturbation theory and by quadratic configuration interaction. Total atomization energies for a set of 24 species agree with accurate experimental data to an accuracy of better than 3 kcal/mol in most cases, SO_2 being the notable exception. Similar agreement is achieved for ionization energies, electron affinities, and proton affinities. The method is used to assess experimental data for a number of other compounds having less accurate atomization energies.

52004 **Monte Carlo simulations of hydrophobic polyelectrolytes. Evidence for a structural transition in response to increasing chain ionization.** Hooper, H.H. (Chemical Engineering Department, University of California, Berkeley, CA (USA)); Beltran, S.; Sassi, A.P.; Blanch, H.W.; Prausnitz, J.M. *Journal of Chemical Physics (USA),* 93(4): 2715-2723 (15 Aug 1990). DOE Contract AC03-76SF00098.

Monte Carlo simulation has been used to study the configurational properties of a lattice-model isolated polyelectrolyte with attractive segment–segment interaction potentials. This model provides a simple representation of a hydrophobic polyelectrolyte. Configurational properties were investigated as a function of chain ionization, Debye screening length, and segment–segment potential. For chains with highly attractive segment–segment potentials (i.e., hydrophobic chains), large, global changes in polymer dimensions were observed with increasing ionization. The transformation from a collapsed chain at low ionization to an expanded chain at high ionization becomes increasingly sharp (i.e., occurs over a smaller range of ionization) with increasing chain hydrophobicity. The ionization-induced structural transitions for this model hydrophobic polyelectrolyte are analogous to pH-induced transitions seen in real polyelectrolytes and gels. These studies suggest a simple explanation for such transitions based on competing hydrophilic and hydrophobic interactions.

Two phenomena of plasma-particle interactions are reported: creation of comet-like plasma plumes downstream from each particle after initial heating, and failure of the particles (but not the comets) to follow fluctuations in the visible plasma. A diagnostic method to measure true gas temperature and flow fields in thermal plasmas by Doppler-shifted Rayleigh scattering is reported in detail. Evidence for departure of plasmas from local thermal equilibrium (LTE) is presented, and its significance briefly discussed. 9 refs., 7 figs.

52006 (LA-UR–90-3311) **Concepts in strong Langmuir turbulence theory.** DuBois, D.F.; Rose, H.A. Los Alamos National Lab., NM (USA). [1990]. 32p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9007136–4: 1990 summer workshop on nonlinear and chaotic phenomena in plasmas, solids, and fluids, Edmonton (Canada), 16-27 Jul 1990). Order Number DE91000208. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Some of the basic concepts of strong Langmuir turbulence (SLT) theory are reviewed. In SLT system, a major fraction of the turbulent energy is carried by local, time-dependent, nonlinear excitations called cavitons. Modulational instability, localization of Langmuir fields by density fluctuations, caviton nucleation, collapse, and burnout and caviton correlations are reviewed. Recent experimental evidence will be presented for SLT phenomena in the interaction of powerful HF waves with the ionosphere and in laser-plasma interaction experiments. 38 refs., 11 figs.

52007 (UCRL-CR–105052) **Simulation and theory of radial equilibrium of plasmoid propagation: Final report.** Campbell, M.M.; Clark, R.M.; Mostrom, M.A. Lawrence Livermore National Lab., CA (USA); Mission Research Corp., Albuquerque, NM (USA). Sep 1989. 65p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (MRC/ABQ-R–1208). Order Number DE91000803. Source: NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Cases simulating beam currents to about 29 MA were done. Significant noise reduction and code speed-up were achieved for these cases. The net current scaling observed at lower beam current ($I_{net} \sim I_{beam}^{1/2}$) continued to hold up well, as did the equilibrium itself. A slight deviation in the expected thickness and radial structure of the current layer was observed, however. A laminar flow model is developed that appears to give good agreement with the simulation results. Suggestions for future work are discussed briefly.

52008 **Models of intermittency in hydrodynamic turbulence.** Kraichnan, R.H. (303 Potrillo Drive, Los Alamos, NM (USA)). *Physical Review Letters (USA),* 65(5): 575-578 (30 Jul 1990). DOE Contract W-7405-ENG-36.

A heurisitic model for evolution of the probability distribution (PDF) of transverse velocity gradient s in incompressible Navier-Stokes turbulence is distilled from an analytical closure for Burgers turbulence. At all Reynolds number *scrR*, the evolved PDF is $\propto |s|^{-1/2} \exp(-\text{const} \times |s| / \langle s^2 \rangle^{1/2})$ for large $|s|$. The model suggests that skewness and flatnesses are asymptotically independent of *scrR*, and that cascade to smaller scales is not a fractal process. For Burgers dynamics, both simulations and the analytical closure give a PDF $\propto |\xi|^{-1} \exp(-\text{const} \times |\xi| / \langle \xi^2 \rangle^{1/2})$ for large negative velocity gradient ξ.

52010 (LBL–26455, pp. 58-59) **Localization of multivibrational excitations.** Wartak, M.S.; Yang, L.H.; Fong, C.Y.; Shen, Y.R. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

The problem of localization in fermion systems has received a great deal of attention in the last two decades. However, the parallel behavior in the boson systems has rarely been discussed. In reality, multiple excitations can readily occur in a boson system; the appearance of localization of multiple excitations in a boson system is also not uncommon. The existence of local vibrational modes in a polyatomic molecule, for example, has recently stimulated a tremendous amount of interest. The possibility of observing localized multiple vibrational excitations in molecular liquids and solids is very intriguing. In weakly bonded molecular polymers or clusters, how well the multiple vibrational excitations are localized can be a subject of fundamental importance. In all these cases, it will be very interesting if it is possible to identify the physical mechanism that causes the localization. They have studied the localization of multivibrational states in the one-dimensional boson system with onsite random anharmonicity. By introducing site basis state (local representation), they were able, in the limit of $\Delta/\bar{\Lambda} << 1$, where Δ is the coupling interaction between the nearest neighbors and $\bar{\Lambda}$ is the average on site anharmonic energy, to reduce to problem to Anderson-like model for a one-dimensional electron system with diagonal disorder. Assuming a Cauchy distribution for onsite anharmonicity, they have calculated the degree of localization. It is shown that the degree of localization increases with the increase of randomness.

Soudan 2 is an 1100-ton tracking calorimeter which is being constructed to search for nucleon decay. The detector consists of finely segmented iron instrumented with drift tubes, and records three spatial coordinates and dE/dx for every gas crossing. Excellent event-reconstruction capability, particle identification, and muon sign and direction determination give superior rejection of the neutrino background to nucleon decay in many modes. Predicted detector performance has been verified using cosmic rays tracks and a charged particle test beam calibration. The first 516 tons of Soudan 2 are now in steady operation, with completion planned for 1992. Initial data on neutrino interactions in the first 0.23 fiducial-kiloton-year exposure are described here, as are preliminary results of a search for GUT magnetic monopoles. Plans for studies with single and multiple cosmic-ray muon events, and with contained atmospheric neutrino interactions, are also presented. 7 refs., 6 figs.

52012 (CONF-8908131–7) **Pion double charge exchange scattering above the delta resonance.** Burleson, G.R. New Mexico State Univ., Las Cruces, NM (USA). Dept. of Physics. [1989]. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract FG04-88ER40403. From 2. LAMPF workshop on pion-nucleus double charge exchange; Los Alamos, NM (USA); 9-11 Aug 1989. Order Number DE91000606. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Data are presented on pion-nucleus double-charge-exchange scattering at energies between 300 and 500 MeV, the highest energies measured so far, together with a review of results at lower energies. The small-angle excitation functions disagree with predictions based on a sex-quark cluster model and on an optical model consistent with single-charge-exchange scattering at these energies, but they are consistent with a distorted-wave calculation. Data on $f_{7/2}$-shell nuclei are in partial agreement with a two-amplitude model which is successful at lower energies. In order to achieve good understanding of this process at these energies, more work; both experimental and theoretical, is needed. 16 refs., 6 figs.

Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

For the past seven years, this group has been interested in the study of tests of the Standard Model of Electroweak interactions. The program has centered about the AMY experiment which examines the nature of the final state products in electron-positron collisions in the center of mass energy range near 60 GeV. Results of these measurements have shown a remarkable consistency with the predictions of the minimal model of 3 quark and lepton generations and single charged and neutral intermediate bosons. No new particles or excited states have been observed nor has any evidence for departures in cross sections or angular asymmetries from expectations been observed. These conclusions have been even more firmly established by the higher energy results from the LEP and SLC colliders at center of mass energies of about 90 GeV. Our focus is shifting to the neutrino as a probe to electroweak interactions. The relative merit of attempting to observe neutrinos from point sources versus observing neutrinos generally is not easy to predict. The improved ability to interpret is offset by the probably episodic nature of the emission and irreproducibility of the results. In this phase of development, it is best to be sensitive to both sources of neutrinos. As a second phase of our program at Virginia Tech, we are studying the feasibility of detecting cosmic ray neutrinos in a proposed experiment which we have called NOVA. the results of the test setup will be instrumental in developing an optimum design. A third program we are involved in is the MEGA experiment at Los Alamos, an experiment to place a limit on the rate of muon decay to electron plus photon which is forbidden by the Standard Model.

52015 (FNAL/C–90/159-E) **QCD studies at the hadron colliders.** Flaugher, B.L. The CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (USA). 10 Aug 1990. 20p. Two hadron collider experiments are actively pursuing QCD jet analyses. They are CDF, with a $\sqrt{s}$ = 1800 GeV, and UA2, with a $\sqrt{s}$ = 630 GeV. Recent results from these collaborations are discussed. The inclusive jet spectrum, dijet mass and angular distribution are compared to QCD predictions and used to set limits on quark substructure. Data from both experiments are compared to the $O(\alpha_s^3)$ calculations for the inclusive jet cross section. Studies of 3-jet, 4-jet and 5-jet events are described. A limit is set on the cross section for double parton scattering from the UA2 4-jet analysis. The inclusive photon cross section has been measured by both CDF and UA2 and is compared to theoretical predictions. 13 refs., 17 figs., 1 tab.

The perturbative QCD framework as the basis of the parton model is reviewed with emphasis on several issues pertinent to next-to-leading order (NLO) applications to a wide range of high energy processes. The current status of leading-order and NLO parton distributions is summarized and evaluated. Relevant issues and open questions for second-generation global analyses are discussed in order to provide an overview of topics to be covered by the Workshop. 15 refs., 6 figs., 1 tabs.

52018 (IS-M–653) **Signals for W boson compositeness from rare B decays.** Rizzo, T.G. (Wisconsin Univ., Madison, WI (USA). Dept. of Physics). Ames Lab., IA (USA). [1990]. 1p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. (CONF-9006267–4: 1990 DPF summer study on high energy physics, Snowmass, CO (USA), 25 Jun - 13 jul 1990). Order Number DE91000083. Source: NTIS, PC A01/MF A01 - OSTI; GPO Dep.

Chia has recently shown that deviations from the Standard Model (SM) value for the W boson anomalous magnetic moment ($\Delta\kappa$) may be observable via rare decays such as $B \rightarrow K^*\gamma$. This work is reviewed, extended, and updated below. 4 refs., 1 fig.

52019 (IS-T–1420) **Exclusive neutral strange particle production from double Pomeron exchange produced by proton-proton interactions at $\sqrt{s}$ = 62 GeV.** Skeens, J. Ames Lab., IA (USA). 21 Sep 1990. 167p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE91000609. Source: NTIS, PC A08/MF A01; OSTI; INIS; GPO Dep.

Data are presented for the first time on exclusive Pomeron-Pomeron interactions which produce a neutral strange and neutral antistrange particle pair in a central system X. In this paper, the system, X, is identified as one of the following neutral combinations; $K_s^0K_s^0$, $K_s^0K^{\pm}\pi^{\mp}$, $\Lambda^0\bar{\Lambda}^0$, $\Lambda^0\bar{\Lambda}^{0*}$. These data were obtained in proton-proton collisions at $\sqrt{s}$ = 62 GeV at the CERN ISR. The triggering systems used to obtain these data are described, followed by a description of the data. The central system mass distributions are presented along with differential mass cross section estimates. A broad enhancement is seen in the $K_s^0K_s^0$ system at a mass of 1.2 GeV, and is likely to have the quantum numbers $J^{PC} = 0^{++}$. Total cross section estimates of 1.3 $\pm$ .64 μb in the $K_2^0K_s^0$ system, . 44 $\pm$ .14 μb in the $K_s^0K^{\pm}\pi^{\mp}$ system, .20 $\pm$ .14 μb in the $\Lambda^0\bar{\Lambda}^0$ system, and .13 $\pm$ .06 μb in the $\Lambda^0\bar{\Lambda}^{0*}$ system are obtained.

52020 (LA–11905-T) **A measurement of $\Delta\sigma_L$(np), the difference between neutron-proton total cross sections in pure longitudinal spin states.** Beddo, M.E. Los Alamos National Lab., NM (USA). Oct 1990. 184p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36 ;FG04-88ER40403. Order Number DE91000885. Thesis. Submitted to New Mexico State University, Las Cruces, NM.

A measurement off $\Delta\sigma_L$(np), the difference between neutron-proton total cross sections in pure longitudinal spin states, is described. The results will help determine the isospin-zero (I = 0) scattering amplitudes, which are not well known above laboratory energies of 500 MeV, whereas the isospin-one (I = 1) amplitudes are fairly well-determined to 1 GeV. Data points were taken at the Los Alamos Meson Physics Facility (LAMPF) at Los Alamos, New Mexico, for five neutron beam energies: 484, 568, 634,720 and 788 MeV; they are the first in this energy range. Polarized neutrons were produced by charge-exchange of polarized protons on a liquid deuterium target (LD_2). Large-volume neutron counters detected the neutrons that passed through a polarized proton target. The counters subtended a range of solid angles large enough to allow extrapolation of the scattered neutrons to 0°. Two modifications to the LAMPF accelerator system which were made for this work are described. They included a "beam buncher," which modified the normal rf-time structure of the proton beam and allowed for

the selection of peak-energy neutrons by time-of-flight means, and a computerized beam steering program, which reduced systematic effects due to beam motion at the LD_2 target. The experimental values of $\Delta\sigma_L$(np) are found to be consistent with other np data, including preliminary data from SIN and Saclay, but not with some results from Argonne which used a polarized proton beam and a polarized deuteron target. The I = 0 component was extracted from $\Delta\sigma_L$(np) using existing pp data (I = 1), with the unexpected result that $\Delta\sigma_L$(I = 0) was found to be essentially identical in shape to $\Delta\sigma_L$(I = 1). The significance of this is not yet understood.

52021 (LA-UR-90-2984) **Phenomenology of some rare and forbidden η-decays.** Herczeg, P. Los Alamos National Lab., NM (USA). [1990]. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-9003177–2: International workshop on rare decays of light mesons, Gif-sur-Yvette (France), 29-30 Mar 1990). Order Number DE91000437. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We discuss the contribution from possible new physics to the decays $\eta \to \mu^+\mu^-$, $\eta \to e^+e^-$, $\eta \to \mu e$ and $\eta \to \pi\mu e$, and assess the sensitivities required for experimental studies of these decays to extend our knowledge about the new interactions. 61 refs.

52022 (LA-UR-90-3359) **Rare decays.** Sanders, G.H. Los Alamos National Lab., NM (USA). [1990]. 13p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9006276–1: 14. international conference on neutrino physics and astrophysics, Cern (Switzerland), 10-15 Jun 1990). Order Number DE91000169. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Rare decay experiments have made significant advances in the last several years. Limits on lepton number violating decays of kaons have been tightened. Large samples of strangeness changing neutral current kaon decays have been collected. For several suppressed processes, discovery windows for new physics have been substantially narrowed. Opportunities for detecting direct CP-violation have been changed by the observation of a new background to one decay mode and the prospects of high statistics studies of another process. 23 refs., 14 figs., 2 tabs.

52023 (LBL–29347) **The meson spectrum between 1 and 2 GeV: Gluonic states and other exotica.** Chanowitz, M.S. Lawrence Berkeley Lab., CA (USA). 20 Jul 1990. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-900601–12: 12. PANIC international conference on particles and nuclei, Cambridge, MA (USA), 24-29 Jun 1990). Order Number DE91000243 Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Present understanding of the meson spectrum is reviewed, with special attention on the search for gluonic states. Experimental progress has resulted in several paradoxes indicating states outside the $\bar{q}q$ spectrum of the nonrelativistic quark model. 59 refs., 1 fig., 2 tabs.

52024 (LBL–29488) **Concept for an experiment on particle and jet production at midrapidity.** Harris, J.W. (Lawrence Berkeley Lab., CA (USA)); Bloomer, M.; Chase, S.I.; Christie, W.; Friedlander, E.; Greiner, D.; Gruhn, C.; Gyulassy, M.; Jacobs, P.; Naudet, C.; Nygren, D.; Odyniec, G.; Olson, D.; Poskanzer, A.; Rai, G.; Ritter, H.G.; Schroeder, L.SLawrence Berkeley Lab., CA (USA). Jul 1990. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-900772–5: 4. workshop on experiments and detectors for a relativistic heavy ion collider, Upton, NY (USA), 2-7 Jul 1990). Order Number DE91000190. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The concept for an experiment to study global event signatures of quark Gluon Plasma formation and to investigate the propagation of jets through strongly interacting matter at high density is presented. Both event-by-event and inclusive measurements of physical observables can be made at midrapidity over a large solid angle ($|\eta|<1$) with full azimuthal coverage ($\Delta\phi = 2\pi$) and azimuthal symmetry. The detection system consists of a vertex detector and time projection chamber (TPC) inside a solenoidal magnet for tracking, momentum analysis and particle identification; a time-of-flight system surrounding the TPC for particle identification at higher momenta; and electromagnetic and hadronic calorimetry to measure and trigger on jets and the transverse energy of events. 7 figs., 2 tabs.

52025 (MPI-PAE/Exp.El.–227) **Heavy quark charge asymmetries below the Z^0 resonance.** Kroha, H. Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik. Jul 1990. 46p. (CONF-900822–: 25. IUPAP international conference on high energy physics, Singapore (Singapore), 2-8 Aug 1990). Source: Available from Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik.

The status of charge asymmetry measurements for charm and bottom quarks below the Z^0 resonance is reviewed. An up-to-date compilation including the latest results is given. The combined charge asymmetry measurements are used to determine world average values for the weak neutral current couplings of the heavy quarks and to set limits on flavour oscillations in the neutral B π.eson system and on a possible common substructure of electrons and heavy quarks. The results for the axial-vector couplings of c and b quarks are a_c=+(0.98±0.16) and a_b=-(0.61±0.12), respectively, without taking B^0anti B^0 mixing into account. The sensitivity of the combined b asymmetry measurements for B^0anti B^0 oscillations has increased considerably leading to the result χ_l=0.171±0.065 for the mixing parameter. This value combined with measurements from like-sign dilepton production gives the first experimental confirmation for non-zero $B_s{}^0$ mixing, at a confidence level of more than 95%. Lower limits on the compositeness scale for electron and heavy quark contact interactions were obtained in the 1-3 TeV range (at 95% C.L.). (orig.).

52026 (PHE–86-13, pp. 334-340) **Electroweak precision measurements and radiative corrections at European Large Electron-Positron Storage rings (LEP)/Stanford linear collider (SLC).** Riemann, T. This not gives a motivation to do the programme 'ANALYTIC BREMSSTRAHLUNG INTEGRATION' and contains compact expressions for $e^+e^- \to \mu^+\mu^-(\gamma)$ and numerical results for total cross sections σ_{tot}, forward-backward asymmetry (A_{FB}), $d\sigma/d\cos\Theta$. (author).

52027 (SLAC-PUB–5115) **A search for new particles in Z decay.** Innes, W. Mark II Collaboration. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Nov 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890903–14: International Europhysics conference on high-energy physics, Madrid (Spain), 6-14 Sep 1989). Order Number DE91000460. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

We have searched 310 hadronic Z decays for evidence of new quarks and leptons. We set lower mass limits of 40.7 GeV/c^2 for top, 45 GeV/c^2 for bottom prime, and 42.4 GeV/c^2 for a heavy neutral lepton assuming their decays are predominantly via the charged current. Limits are also set for other decay modes and for mixtures of decay modes. 10 refs., 10 figs.

52028 **Proceedings of the VIIth International workshop on photon-photon.** Courau, A. (Lab. de l'Accelerateur Lineaire, Orsay Cedex (FR)); Kessler, P. 485p. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). (CONF-8604238–: 7. international workshop on photon-photon collisions, Paris (France), 1-5 Apr 1986).

Topics covered in this book include: Applications of amplitude factorization to double gamma production of vector meson pairs; Experimental results on jets; and Four-lepton production in photon-photon collisions.

52029 **Theoretical implications of the W-Z mass difference and the capabilities of the D0 detector in measuring it.** Raja, R. (Fermi National Accelerator Lab., Batavia, IL (US)). pp. 3-29 of

Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

The authors examine the phenomenology of the W-Z mass difference as a function of the top quark mass and the Higgs mass. A detailed analysis is presented on how well the mass difference is measurable using the D0 detector at Fermilab. The authors show that the effective mass distribution of the Z^0 is not a Breit-Wigner at the Tevatron and present techniques developed for the D0 detector simulation that can be used to reduce the systematic errors in measuring the W-Z mass difference. Scenarios are presented for the integrated luminosities of 10 pb^{-1} and 100 pb^{-1} at the Tevatron. It is shown that the Tevatron is competitive with LEP II for integrated luminosities of 100 pb^{-1} in attainable precisions in this measurement. These considerations argue strongly for the pp option in the Tevatron upgrade program.

52030 W boson production in $\bar{p}p$ collisions at square root of s = 1.8 TeV. Proudfoot, J. (High Energy Physics Div., Argonne National Lab., Argonne, IL (US)). pp. 72-82 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 DOE Contract W-31-109-ENG-38. (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

This paper reports how the cross section for the production and subsequent decay of the W intermediate Vector boson to electron and neutrino has been measured in square root s = 1.8 TeV $\bar{p}p$ collisions using the CDF Collider Detector at Fermilab. For this measurement, W events were identified from the large missing transverse energy associated with the unseen neutrino and an electromagnetic cluster passing rather loose electron criteria. 22 events passing the selection missing transverse energy greater than 25 GeV and electron transverse energy greater than 15 GeV were observed in a sample of 25nb^{-1} yielding a $\sigma \cdot B = 2.6 \pm 0.6 \pm 0.5$nb. This result agrees well with a parallel analysis based primarily on the identification of isolated electrons and is in excellent agreement with theoretical predictions.

52031 Resonance production in photon-photon collisions. Shen, B.C. (Univ. of California, Riverside, CA (US)). pp. 3-24 of Proceedings of the VIIth international workshop on photon-photon. Courau, A.; Kessler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 485 (CONF-8604238–: 7. international workshop on photon-photon collisions, Paris (France), 1-5 Apr 1986).

A large number of $\gamma\gamma$ width measurements have been reported. The authors review the present status of pseudoscalar and tensor mesons. The world averages of the $\gamma\gamma$ width measurements are used to obtain the SU(3) mixing angles, and to determine the gluon contents. The experimental situation of scalar mesons is discussed. The measured limits on the $\gamma\gamma$ widths of various higher mass states are reviewed. The overall experimental situation is summarized.

52032 Minimum bias physics at square root s 1.8 TeV. Para, A. pp. 131-156 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

Charged particles production at center- of-mass energies ($\sqrt{s}$) of 630 and 1800 GeV is studied using the Collider Detector (CDF) at Fermilab. Inclusive transverse momentum and pseudorapidity distributions are compared with low energy measurements and with theoretical models. Preliminary results on the inclusive strange particle and short range correlations are presented.

52033 $Z^0 \rightarrow N_4\bar{\nu} \rightarrow$ monojet. Rhie, S.H. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp. 111-115 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 DOE Contract AC03-76SF00515. (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper discusses fourth-generation neutrinos that can be produced from on-shell Z^0 decays at the SLC or LEP. The author refers to neutrinos as heavy or light depending on whether the mass is larger or smaller than half of the mass of the Z^0. Let N denote the heavy neutrino.

52034 Evidence for the decay $\tau^- \rightarrow \pi^- \eta \nu_\tau$. Repond, J. (Argonne National Lab., Argonne, IL (US)). pp. 152-158 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper discusses the High Resolution Spectrometer collaboration that has searched for undetected decay channels of the τ-lepton. In particular, as the classification of one-prong decays indicates a higher rate than expected for the one-charged plus multiple-neutral channel, the author has searched for η-meson production in one-prong τ-decays. The analysis that gave evidence for the decay $\tau^- \rightarrow \pi^- \eta \nu_\tau$ is outlined. The author discusses the checks that have been done, including the background from hadronic- and two-photon events, and the probability of missing photons.

52035 Limits on fourth-generation neutrino masses and majoron emission from a double beta decay search. Caldwell, D.O. (Physics Dept., Univ. of California, Santa Barbara, CA (US)); Eisberg, R.M.; Grumm, D.; Witherell, S.; Goulding, F.W.; Smith, A.R. pp. 104-110 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper discusses a low-energy process and the limits it sets on the mass of a fourth-generation Majorana neutrino as a function of its coupling to a first generation neutrino. The authors offer remarks on whether a particular experiment confirmed the reported possible observation of $\beta\beta_{0\nu}$ induced by majoron emission.

52036 A status report on the SLC program. Prescott, C.Y. (Stanford Univ., CA (USA)). pp. 118-137 of Test of electroweak theories: Polarized processes and other phenomena. Lynn, B.W.; Verzegnassi, C. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 461 (CONF-8506204–: Workshop on tests of electroweak theories, polarized processes and other phenomena, Trieste (Italy), 10-12 Jun 1985).

This paper presents status report on the progress of the SLC machine and two detectors.

52037 Experimental status of the N→Δ transition. Papanicolas, C.N. (Univ. of Illinois at Urbana-Champaign, Dept. of Physics and Nuclear Physics Lab., Urbana, IL (US)). pp. 235-255 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

The resonant quadrupole excitation of the Δ^+ (1232) can provide a sensitive observable needed to quide QCD inspired hadron phenomenology. The available experimental evidence is reviewed in the light of the recent extensive theoretical studies of this issue. The limitation of the available data are carefully examined in order to provide guidance to future measurements. The authors conclude by suggesting a novel approach in which the N→Δ transition is simultaneously studied in both the $(\vec{e}, e'\gamma)$ and $(\vec{e}, e'\pi^o)$ channels.

52038 Inclusive central jets at the Tevatron $\bar{p}p$ collider. Garfinkel, A.F. (Purdue Univ., West Lafayette, IN (US)). pp. 202-216 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

A measurement of the central inclusive jet cross section at square root s = 1.8 TeV using the CDF detector at the Tevatron $\bar{p}p$ Collider is presented. Comparisons are made to QCD calculations as well as to lower energy collider data.

52039 Jet fragmentation properties at CDF. Hubbard, B. (Lawrence Berkeley Lab., Berkeley, CA (US)). pp. 262-272 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

Fragmentation properties of centrally produced jets at CDF have been studied. The rapidity (Y) distribution of charged particles to the jet axis is presented. The mean charged multiplicity in the jet core (at rapidities above 2) is seen to rise with increasing di-jet invariant mass (M_{JJ}), from 3 at M_{JJ} = 200 GeV. This is in agreement with expectations and follows the trend of previous experimental results.

52040 Status of Brookhaven rare kaon decay experiments. Cousins, R.D. (Physics Dept., Univ. of California, Los Angeles, CA (US)). pp. 283-290 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper summarizes the goals and status of the four rare kaon decay experiments at Brookhaven National Laboratory (BNL). The author describes other experiments and focuses on their status. Physics motivation and background calculations are presented.

52041 Radiative corrections in $SU_2 \times U_1$: LEP/SLC. Lynn, B.W. (Stanford Univ., CA (USA)); Peskin, M.E.; Stuart, R.G. pp. 213-298 of Test of electroweak theories: Polarized processes and other phenomena. Lynn, B.W.; Verzegnassi, C. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 461 (CONF-8506204–: Workshop on tests of electroweak theories, polarized processes and other phenomena, Trieste (Italy), 10-12 Jun 1985).

This paper shows the sensitivity of various experimental measurements to one-loop radiative corrections in $SU_2 \times U_1$. Models considered are the standard GSW model as well as extensions of it which include extra quarks and leptons, SUSY and certain technicolor models. The observation of longitudinal polarization is a great help in seeing these effects in asymmetries in $e^+e^- \rightarrow \mu^+\mu^-, \tau^+\tau^-$ on Z^0 resonance.

52042 Nuclear structure in delta and S11 resonance regions. Doyle, B.C. (Rensselaer Polytechnic Institute, Troy, NY (US)). pp. 373-382 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

Recent pion photoproduction calculations in the 1p-shell use nuclear transition density matrix elements (TDRMEs) extracted from low energy electromagnetic and weak observables. The authors critique use of harmonic oscillator radial wavefunctions in these calculations for momentum transfers exceeding a cutoff obtained from fits to electron scattering form factors. Cutoffs are signaled by a rapid rise in χ^2 and are below the momentum transfer to the nucleus in the delta and S11 resonance regions for pion and eta photoproduction, respectively, for most of the differential cross-section's angular range. Due to the large eta mass (549 MeV), momentum transfer at threshold ($2.7fm^{-1}$) exceeds the cutoffs.

52043 Order α^2 δ corrections to W and Z transverse momentum distributions at the SPS and Tevatron colliders. Arnold, P.B. (Fermilab, Batavia, IL (US)); Reno, M.H. pp. 336-344 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

The authors present numerical results from the full $\alpha_s{}^2$ computation of $d\sigma/dq^2{}_T$ for W's and Z's at square root s = 630 and 1800 GeV.

52044 Searching for fourth-generation fermions at high-energy e^+e^- machines. Dorfan, J. (Stanford Linear Accelerator Center, Stanford Univ., Stanford CA (US)); Van Kooten, R.J. pp. 319-331 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The N.Y. Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper summarizes studies on the feasibility of searching for fourth-family fermions at high-energy e^+e^- machines. The authors describe their studies and include consideration of a canonical fourth family in the Standard Model. They suggest the possibility that the fourth-generation neutral lepton is massive.

52045 Radiative kaon capture in hydrogen. McIntyre, E.K. (Boston Univ., Boston, MA (US)); Booth, E.C.; Gall, K.P.; Miller, J.P.; Roberts, B.L.; Whitehouse, D.A.; Fickinger, W.J.; Robinson, D.K.; Hasinoff, M.D.; Measday, D.F.; Noble, A.J.; Hessey, N.P.; Lowe, J.; Horvath, D.; Sakitt, M.; Skelly, J. pp. 434-438 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

Negative kaons were stopped in liquid hydrogen to measure the radiative capture rates to $Y\gamma$ final states. Branching ratios for the reactions $K^-p \rightarrow \Lambda\gamma$ and $K^-p \rightarrow \Sigma^0\gamma$ provide information about the quark structure of the $\Lambda(1404)$. Superior photon resolution is needed to distinguish the signal photons from the background of π^0 decay photons. Such resolution was provided by a NaI detector, which has a resolution of 1.3% (FWHM) near 300 MeV. A description of the experimental technique and data reduction is presented, along with preliminary branching ratio results.

52046 Photon-photon physics with the Mark II at PEP. Gidal, G. (Lawrence Berkeley Lab. and Dept. of Physics, Univ. of California, Berkeley, CA (US)). pp. 418-434 of Proceedings of the VIIth international workshop on photon-photon. Courau, A.; Kessler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 485 DOE Contract AC03-76SF00098 ;AC03-76SF00515. (CONF-8604238–: 7. international workshop on photon-photon collisions, Paris (France), 1-5 Apr 1986).

This paper reports on photon-photon interactions studied with Mark II detector at PEP. The inclusive production of charged hadrons at large transverse momenta and the exclusive production of meson pairs at large invariant mass are compared with recent hard scattering calculations. Copious inclusive production of K^0's at large transverse momenta provides evidence for charm production. The radiative width of the f'(1520) is measured via its $K_s{}^0\bar{K}_s{}^0$ decay mode.

52047 Prospects of Tevatron upgrade. Syphers, M.J. (Fermi National Accelerator Lab., Batavia, IL (US)). pp. 581-598 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

Following a brief review of the 1987 Fermilab collider run and the present status of the 1988 run, upgrade plans for the near-term are described. For further luminosity upgrades beyond 1992, several scenarios are currently being discussed, one of which includes the construction of two new 20 GeV rings which could raise the proton-antiproton collider luminosity by a factor of 50 over the original Tevatron I design. Another possible project, the construction of a high luminosity proton-proton collider, has also been investigated in detail. A third scenario, involving a new main injector to replace the main ring and a new higher energy superconducting synchrotron, is examined. It is hoped that this will result in a proposal. The major issues concerning these options are presented.

52048 CDF's prospect for top search and other heavy flavor physics. Yoh, J. (Fermi National Accelerator Lab., Batavia, IL (US)). pp. 685-698 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

The ability of CDF to search for the top quark is discussed. For the 1988-9 run, we expect to collect data corresponding to 5 inverse picobarns for integrated luminosity, making the discovery of

a top quark with masses of up to 90 - 110 GeV likely. Future runs, with possible integrated luminosities of 15, 50 and 500 inverse picobarns, should achieve mass limits of respectively 125, 150, and 220 GeV. The most likely mode for discovery is discussed, along with some discussion of probable backgrounds. A preliminary analysis of data from the CDF run of 1987 is used to set limits on possible backgrounds to a top signal. Prospects for other heavy flavor physics are also briefly discussed.

52049 **Observation of narrow structures in the *p-p* elastic analyzing power.** Shimizu, H. (Department of Physics, Tokyo Institute of Technology, Tokyo 152 (Japan)); Yoshida, H.Y.; Ohnuma, H.; Kobayashi, Y.; Kobayashi, K.; Nakagawa, T.; Holt, J.A.; Glass, G.; Hiebert, J.C.; Kenefick, R.A.; Nath, S.; Northcliffe, L.C.; Simon, A.; Hira *Physical Review, C (Nuclear Physics) (USA)*, 42(2): R483-R486 (Aug 1990). DOE Contract FG05-88ER40399.

The momentum dependence of the analyzing power A_y in proton-proton elastic scattering has been measured in small steps using an internal target during polarized beam acceleration from 1 to 3 GeV/*c*. The momentum bin size ranges from 5 to 18 MeV/*c*. The relative uncertainty of A_y is typically less than 0.01 for each momentum bin. Narrow structures have been found in the two-proton invariant mass distribution of A_y.

6452 Particle Interactions and Properties - Theoretical

52050 (BONN-ME-90-04) **Vector meson dominance and pointlike coupling of the photon in soft and hard processes.** Paul, E. Bonn Univ. (Germany, F.R.). Physikalisches Inst. May 1990. 23p. (CONF-9002151--: Workshop on vector dominance phenomena in the interaction of photons with hadrons and nuclei, Goettingen (Germany, F.R.), 20 Feb 1990). Order Number DE91706311. Source: NTIS (US Sales Only), PC A03/MF A01.

Recent experimental results on photoproduction of hadrons probe the nature of the interacting photon over a wide kinematical range from soft to hard processes. Single inclusive spectra and energy flows of the final state charged particles are well described by assuming that photon production data are built up by an incoherent superposition of a soft Vector-Meson-Dominance component and a hard pointlike photon component. (orig.).

Southeastern Universities Research Association, Newport News, VA (USA). Continuous Electron Beam Accelerator Facility. [1990]. 16p. Sponsored by U.S. DOE Energy Research; National Aeronautics and Space Administration; National Science Foundation. DOE Contract AC05-84ER40150 ;FG05-88ER40435. Grant RII-8704038;Grant NAG-1-447. (CEBAF-PR-90-006). Order Number DE91000626. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A covariant pion wave function, which reproduces the low energy data, is used to calculate the perturbative gluon exchange contributions to the pion charge form factor. It is found that the perturbative process dominates at $q > 3.5$ GeV/c. The dependence on the quark mass and the asymptotic behavior of the form factor are explicitly displayed.

52052 (DOE/ER/40150-136) **Standard model bosons as composite particles.** Kahana, D.E. (Southeastern Universities Research Association, Newport News, VA (USA). Continuous Electron Beam Accelerator Facility); Kahana, S.H. Southeastern Universities Research Association, Newport News, VA (USA). Continuous Electron Beam Accelerator Facility. [1990]. 13p. The Standard model of electro-weak interactions is derived from a Nambu, Jona-Lasinio type four-fermion interaction, which is assumed to result from a more basic theory valid above a very high scale Λ. The masses of the gauge bosons and the Higgs are then produced by dynamical symmetry breaking of the Nambu model at an intermediate scale μ, and are evolved back to experimental energies via the renormalisation group equations of the Standard model. The weak angle $\sin^2(\theta_W)$ is predicted to be 3/8 at the scale μ, as in grand unified theories, and is evolved back to the experimental value at scale M_W, thus determining $\mu \sim 10^{13}$GeV. Predictions for the ratios of the masses of the gauge and the Higgs bosons to the top quark mass, at experimental energies, are also obtained.

52053 (DOE/ER/40213-7) **Theory and phenomenology of strong and weak interaction high energy physics: Progress report.** Carruthers, P.; Thews, R.L. Arizona Univ., Tucson, AZ (USA). Dept. of Physics. 29 Aug 1990. 30p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER40213. Order Number DE91000977. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper deals with research being conducted at the University of Arizona in the theory of strong and weak interactions. Topics in Quantum chromodynamics, quantum electrodynamics, symmetry principle, hadronic structure of the photon and other are discussed. (LSP)

52054 (GSI-90-34(prepr.)) **Localized Higgs-Fermion states.** Harley, D. (Arizona Univ., Tucson (USA). Dept. of Physics); Soff, G.; Rafelski, J. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Jul 1990. 10p. Order Number DE91706320. Source: NTIS (US Sales Only), PC A02/MF A01.

We obtain spherically symmetric classical solutions to the strongly coupled Higgs-Fermion fields in the electroweak $SU(2)_L xU(1)_y$ standard model. We find that there exists an upper limit on the physical mass of Fermions due to the non-perturbative distortion of the Higgs vacuum in the vicinity of localized Fermion solutions. For a reasonable range of Higgs masses, the upper limit on the Fermion mass is of the order of 2 TeV. (orig.).

52055 (GSI-90-37(prepr.)) **Strangeness and quark gluon plasma: Aspects of theory and experiment.** Eggers, H.C. (Arizona Univ., Tucson (USA). Dept. of Physics); Rafelski, J. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Jul 1990. 42p. Order Number DE91706312. Source: NTIS (US Sales Only), PC A03/MF A01.

A survey of our current understanding of the strange particle signature of quark gluon plasma is presented. Emphasis is placed on the theory of strangeness production in the plasma and recent pertinent experimental results. Useful results on spectra of thermal particles are given. (orig.).

52056 (INS-832) **Comment on confining theory of quarks, leptons and sarks.** Yasue, Masaki. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jul 1990. 14p. Order Number DE91713079. Source: NTIS (US Sales Only), PC A03/MF A01.

The confining $SU(2)_L^{loc}$ theory for composite quarks, leptons and extra weak-triplet and-singlet fermions (called sarks), which fixes the generation number ≤ 3 as suggested by Frampton and Ng (FN) in their sark model, is shown to incorporate extra composite W and Z bosons, W' and Z', as the remnant of confined hypercolors carried by sark constituents. The model deals with $SU(2)_L^{loc}$- and hypercolor-singlet composites that exhibit the duality of compositeness and 'elementariness', in which it differs from the original FN's sark model. W' and Z' primarily couple to sarks but not to quarks and leptons while the indirect coupling of Z' to quarks and leptons is induced as a result of vector meson dominance of the photon. (author).

52057 (INS-833) **Atmospheric neutrino fluxes.** Honda, M. (Tokyo Univ., Tanashi (Japan). Inst. for Cosmic Ray Research); Kasahara, K.; Hidaka, K.; Midorikawa, S. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jul 1990. 17p. Order Number DE91713078. Source: NTIS (US Sales Only), PC A03/MF A01.

A detailed Monte Carlo simulation of neutrino fluxes of atmospheric origin is made taking into account the muon polarization effect on neutrinos from muon decay. There still remains a significant discrepancy between the calculated $(\nu_e + \text{anti}\nu_e)/(\nu_\mu + \text{anti}\nu_\mu)$ ratio and that observed by the Kamiokande group, which can be explained by three neutrino oscillations. However, the ratio

evaluated at the Frejus site and the total event number calculated for IMB-1 show good agreement with the data. Comparing out result with the previous Monte Carlo calculation by Barr et al., we find that the two calculations agree within 20 % for the magnitude of neutrino fluxes and 5 % for the $(\nu_e + \text{anti}\nu_e)/(\nu_\mu + \text{anti}\nu_\mu)$ ratio. This paper is the revised version for correcting computational errors in the previous preprint, INS-Rep.-807. (J.P.N.).

52058 (IS-M–651) **Radiative corrections and Z′ searches at ep colliders.** Rizzo, T.G. (Wisconsin Univ., Madison, WI (USA). Dept. of Physics). Ames Lab., IA (USA). [1990]. 2p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. (CONF-9006267–5: 1990 DPF summer study on high energy physics, Snowmass, CO (USA), 25 Jun - 13 jul 1990). Order Number DE91000084. Source: NTIS, PC A01/MF A01 - OSTI; GPO Dep.

We examined the sensitivity of the Z′ searches at ep colliders to the unknown values of the top quark and Higgs boson masses (m_t and m_H) in a number of extended electroweak models through the use of polarization asymmetries including the effects of weak radiative corrections.

52059 (IS-M–652) **New gauge boson mass bounds from radiative corrections.** Rizzo, T.G. (Wisconsin Univ., Madison, WI (USA). Dept. of Physics). Ames Lab., IA (USA). [1990]. 2p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. (CONF-9006267–6: 1990 DPF summer study on high energy physics, Snowmass, CO (USA), 25 Jun - 13 jul 1990). Order Number DE91000085. Source: NTIS, PC A01/MF A01 - OSTI; GPO Dep.

Recent data from LEP, the Tevatron, and the CERN Collider on the properties of the W and Z are used together with our knowledge of the radiative corrections in the Standard Model (SM) to place 95% CL lower bounds on the masses of new neutral gauge bosons in a number of extended electroweak models.

52060 (IS-T–1446) **Neutral technicolor pseudo Goldstone bosons production and QCD [quantum chromodynamics] background at the SSC [Superconducting Super Collider].** Kuo, Wang-Chuang. Ames Lab., IA (USA). 21 Sep 1990. 128p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE91000195. Source: NTIS, PC A07/MF A01; OSTI; INIS; GPO Dep.

The production of the neutral technicolor pseudo Goldstone bosons, $P^{0\prime}$ and $P_8^{0\prime}$, at large transverse momentum in pp collisions, $pp \to g(q)P^{0\prime}$ ($P_8^{0\prime}$)X has been investigated in reactions at a high energy collider such as the SSC. The major two-body and three-body decay modes in tree diagrams are investigated in detail. The $t\bar{t}$ decay channel would dominate both the decays of $P^{0\prime}$ and $P_8^{0\prime}$ if it is allowed. Otherwise, gg and 3g will be the dominant decay modes unless the mass of the $P^{0\prime}$ and $P_8^{0\prime}$ are below 40 GeV, where $b\bar{b}$ becomes dominant. According to the QCD backgrounds, which we have also investigated in detail in this work, the signal for $t\bar{t}$ is much larger than the background and will be the ideal signal for detecting these bosons. However, in the absence of the $t\bar{t}$ channel, the $\tau\bar{\tau}$ mode can be used to identify $P^{0\prime}$ up to m_P = 300 GeV in the transverse momentum range $P_\perp \lesssim 100$ GeV. Similarly, the $b\bar{b}$ decay mode can serve us a signal to identify $P_8^{0\prime}$ up to m_P = 300 GeV for $P_\perp$ between 500 and 700 GeV. Our results show that these high transverse momentum production processes are useful for the searching for the $P_8^{0\prime}$ at the SSC. 63 refs.

52061 (KFTI–88-29) **On the supersymmetric generalizations of the action of relativistic massless particles.** Volkov, D.V.; Zheltukhin, A.A. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 15p. (In Russian). Order Number DE91603070. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A supersymmetrical extension of the Penrose twistor representation is suggested and classical equivalence between the theories of spinning and supersymmetrical particles is established. It is shown that the extended Penrose representation is a consequence of the inverse Higgs effect for locally and globally invariant spinor superform. This condisions is generalized to strings and leads to a connection of the grassmanian variables of fermionic strings and superstrings. The method of constructing superfield lagrangians or particles and strings invariant ubder local and global supersymmetries is formulated. 21 refs.

52062 (KFTI–88-31) **On the twistor representation of Siegel transformation for superparticles.** Volkov, D.V.; Sorokin, D.P.; Tkach, V.I. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 12p. (In Russian). Order Number DE91603071. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

It is shown that an explicit incorporation of twistor variables into the Lagrangian of a massless relativistic particle together with the local supersymmetrization of its proper time leads to a Lagrangian which is invariant under the space-time global supersymmetry. The equivalence of the Siegel symmetry and the local proper-time supersymmetry with a complexified grassmanian parameter is established. The Siegel algebra is formed by an irreducible set of covariant constraints and is closed off shell. 20 refs.

52063 (LBL–29466) **Heavy quark production at SLC and LEP.** Hearty, C. Lawrence Berkeley Lab., CA (USA). Jun 1990. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-9006268–2: 10. international conference on physics in collision, Durham, NC (USA), 21-23 Jun 1990). Order Number DE91000225. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Experiments at SLC and LEP have made preliminary measurements of the relative partial widths of the c and b quarks. Using D^* tagging, DELPHI has found $R_c\bar{c} \equiv \Gamma_{c\bar{c}}/\Gamma_{hadr.} = 0.162 \pm 0.032 \pm 0.031$, in good agreement with the Standard Model value of 0.171. ALEPH has used semileptonic decays of charm to obtain $0.148 \pm 0.044\ ^{+0.045}_{-0.038}$. Three experiments have used semileptonic B decays to measurement $R_b\bar{b}$: $R_b\bar{b} = 0.23 \pm 0.10$ (Mark II), $0.218 \pm 0.010 \pm 0.021$ (L3), and $0.220 \pm 0.016 \pm 0.024$ (ALEPH). All agree well with the expected value of 0.217. The uncertainty in branching ratios of c and b hadrons is the largest systematic error in all of the results. Future LEP measurements of the branching ratios may reduce the errors. $R_b\bar{b}$ will also be measured with different, and possibly lower, systematic errors by Mark II using impact parameter tagging.

52064 (LU-TP–90-1) **New results in quantum chromodynamics.** Gustafson, Goesta. Lund Univ. (Sweden). Dept. of Theoretical Physics. Jan 1990. 28p. (CONF-8912118–: 1. international workshop on selected topics in theoretical physics, Hanoi (Viet Nam), Dec 1989). Order Number DE91603048. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Recent developments in QCD are discussed in particular how the dipole formalism and a recently proposed multiplicity measure can be used as efficient tools to study the properties of the QCD shower evolution. The focus is on applications to e^+e^--annihilation into hadrons.

52065 (LU-TP–90-5) **Fractal structures and intermittency in QCD.** Gustafson, Goesta. Lund Univ. (Sweden). Dept. of Theoretical Physics. Apr 1990. 21p. (CONF-9003215–: Santa Fe workshop on intermittency in high energy collisions, Santa Fe, U (USA), 13 Mar 1990). Order Number DE91603049. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

New results are presented for fractal structures and intermittency in QCD parton showers. A geometrical interpretation of the anomalous dimension in QCD is given. It is shown that model predications for factorial moments in the PEP-PETRA energy range are increased. if the properties of directly produced pions are more carefully taken into account.

52066 (MPI-PAE/Exp.El.–230) **Reinvestigation of compositeness limits from e^+e^- annihilation.** Kroha, H. Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik. Aug 1990. 18p. (CONF-900822–: 25. IUPAP international conference on high energy physics, Singapore (Singapore), 2-8 Aug 1990). Source: Available from Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik.

Data of the PEP and PETRA experiments on lepton pair production have been investigated in terms of compositeness. Different

methods are compared for treating the common normalization errors of the data points when fitting the predicted cross sections. We discuss difficulties in the interpretation of experimental limits on the compositeness scale Λ not mentioned in previous measurements. Λ turns out not to be the appropriate parameter to estimate effects of a possible substructure of quarks and leptons. Limits on Λ from different experiments can neither be compared nor combined. A combined analysis of the cross section measurements at PEP and PETRA has therefore been performed in order to determine to which extent new contact interactions can be excluded from present e^+e^- annihilation data. (orig.).

52067 (PHE–86-13, pp. 184-200) **Naturally light higgs doublets in grand unified models.** Krasnikov, N.V. (AN SSSR, Moscow (USSR). Inst. Yadernykh Issledovanij). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The fine tuning problem in grand unified theories is reviewed. It is shown that the nonlocal gauge models with the nonlocal scale $\Lambda \leq 0(1)$ Tev solve the gauge hierarchy problem at least in a technical way. A new mechanism for the explanation of the doublet-trilet problem (problem of the naturally light higgs doublets) is proposed. It is shown that it is possible to break the supersymmetry in the $\alpha = 4$ $E_8 \times E_8$ gauge supersymmetric theory obtained as a low energy limit of superstring theory by nonzero gluino condensates if the E_8 gauge group is broken to $G_1 \times G_2$. (author).

52068 (PHE–86-13, pp. 201-203) **Structure of fermion mass matrices in high dimensional theories.** Wetterich, C. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The structure of fermion mass matrices in higher dimensional theories is investigated considering Yukawa couplings. It is argued that generically no small Yukawa couplings appear in high dimensional theories unless they are protected by symmetries or topological reasons. It is concluded that the structure of fermion mass matrices becomes related to a fine structure of scales at the unification scale.

52069 (PHE–86-13, pp. 215-225) **On dimensional reduction of Einstein-Cartan theory.** Rudolph, G. (Leipzig Univ. (German Democratic Republic). Sektion Physik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

Dimensional reduction of pure gauge theories and gravity is studied. In this framework first the generalized Kaluza-Klein idea based on spontaneous compactification and harmonic expansion as well as the possible role of torsion are investigated. Then a full classification of G-invariant configurations of Einstein-Cartan theory is given. Propositions and theorems are derived and the results are discussed.

52070 (PHE–86-13, pp. 320-333) **Quark-antiquark pair creation in radiative Ψ and Υ transitions.** Lewin, K. (Humboldt-Universitaet, Berlin (German Democratic Republic). Sektion Physik); Motz, G.B. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The contributions of internal charm- and bottom-quark pair creation to some radiation transition rates in the Ψ and Υ family of narrow resonances, respectively, are studied using time-dependent perturbation theory. The lowest order pair creation correction to these radiative transition rates obtained in a quasilocal approximation is applied to electromagnetic charmonium and bottomonium transitions. The used quasilocal approximation shows results with a good accuracy for the bottomonium case.

52071 (SLAC-PUB–5323) **CP asymmetries in B^0 decays beyond the Standard Model.** Dib, C.O. (California Univ., Los Angeles, CA (USA). Dept. of Physics); London, D.; Nir, Y. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1990. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-9006275–1: Workshop on physics and detector issues for a high-luminosity asymmetric B factory, Stanford, CA (USA), 4-8 Jun 1990). Order Number DE91000055. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Of the many ingredients of the Standard Model that are relevant for the analysis of CP asymmetries in B^0 decays, some are likely to hold even beyond the Standard Model while other are sensitive to new physics. Consequently, certain predictions are maintained while other may shoe dramatic deviations from the Standard Model. Many classes of models may show clear signatures when the asymmetries are measured: four quark generations, Z-mediated flavor changing neutral currents, supersymmetry and "real superweak" models. On the other hand, models of left-right symmetry and multi-Higgs sectors with natural flavor conservation are unlikely to modify the Standard Model predictions.

52072 **Theoretical expectations for mass scales of the fourth generation and Higgs bosons.** Hill, C.T. (Fermi National Accelerator Lab., Batavia, IL (US)). pp. 168-179 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper discusses two classes of theories that have something to say about fourth-generation quark and lepton masses. One is based upon universality of low-energy parameters as determined by the renormalization group: infrared fixed points. The other is a toy model of geometric hierarchy that may arise in a novel scheme of dimensional reduction without compactification.

52073 **Photon scattering from the nucleon at LEGS.** Sandorfi, A.M. (Physics Dept., Brookhaven National Lab., Upton, NY (US)); Kistner, O.C.; Matone, G.; Thorn, C.E.; Whisnant, C.S.; Giordano, G.; Schaerf, C.; Blanpied, G.; Preedom, B.M.; Sealock, R.M.; Thornton, S.T. pp. 256-277 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 DOE Contract AC02-76CH00016. (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

The elastic scattering of linearly polarized photons is discussed as a means of measuring the E2/M1 mixing ratio in the excitation of the delta (1232) resonance. The crucial problem in extracting this quantity is the presence of interfering backgrounds. The difference of two scattering cross sections with different incident polarizations can be used to eliminate almost all of the background contributions. As a measure of the sensitivity of this method, such a cross section difference can exhibit a change of 2.4% for an E2/M1 ratio of one percent. The single correction of importance comes from the imaginary part of the fmm(1-) amplitude for magnetic dipole scattering through a spin 1/2 state.

52074 **A dynamical model of pion photoproduction on nucleon in Δ-region.** Blankleider, B. (Paul Scherrer Institute, CH-5234, Villigen (CH)); Lee, T.S.H.; Nozawa, S. pp. 288-292 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565

(CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

Theoretical study has been done on pion photoproduction on the nucleon. Pion production by photons and/or electrons on a nucleon is attractive, because it is the simplest reaction to explore the $\Delta \rightarrow N\gamma$ transition amplitudes. A simple quark model gives pure M1 (or M_{1+}) transition, however, there exists a non-zero E2(or E_{1+}) transition amplitude experimentally. In quark models the non-vanishing E2 amplitude is realized, for example, by an admixture of D-state baryon wave function due to one gluon exchange between quarks. The authors present a model of pion photoproduction which includes FSI in a dynamical way. The model is unitary as well as gauge invariant.

52075 **Approximate four jet cross sections.** Mangano, M. (Fermi National Accelerator Lab., Batavia, IL (US)); Parke, S. pp. 288-298 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

Approximate matrix elements squared are given for all parton processes involving a quark-antiquark pair plus four gluons. Detailed comparisons are made between these results and the exact matrix elements for the subprocesses involving a quark-antiquark pair and four gluons in four jet production at hadron colliders. Together with Maxwell's approximate result for six gluon processes an excellent agreement is found for the shape and total cross section of four jet production.

52076 **Loop-induced rare B decays and the fourth generation.** Soni, A. (Dept. of Physics and Astronomy, Univ. of Pittsburg, Pittsburg, PA (US)); Hou, G.W.S. pp. 255-267 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper discusses loop-induced rare B decays, $b \rightarrow s l^+ l^-$, $s\nu\bar{\nu}$, $s\gamma$, and QCD-induced $b \rightarrow s$ transitions (penguins). Decay rate growth is addressed. The authors point out a pragmatic parameterization of the 4 x 4 mixing matrix suitable for B physics.

52077 **Index theory analysis of Fermion number fractionization.** Niemi, A.J. (Institute for Advanced Study, Princeton, NJ (US)); Semenoff, G.W. pp. 449-462 of Proceedings of a symposium on anomalies geometry topology. Bardeen, W.A.; White, A.R. World Scientific Pub. Co., Teaneck, NJ (USA) (1985). pp. 558 (CONF-8503141–: Symposium on anomalies, geometry and topology, Argonne, IL (USA), 28-30 Mar 1985).

This paper discusses how topologically nontrivial background fields induce zero modes for certain conjugation symmetric Dirac Hamiltonians and that the ensuing ground state degeneracy leads to quantum states with fractional fermion number. An open infinite space index theorem for a special class of Dirac operators is described.

52078 **Chiral weak dynamics.** Morozumi, T. (Rockefeller University, 1230 York Avenue, New York, New York 10021 (USA)); Lim, C.S.; Sanda, A.I. *Physical Review Letters (USA),* 65(4): 404-407 (23 Jul 1990). DOE Contract AC02-87.

We derive a chiral weak Lagrangian which interpolates the QCD-corrected-four-fermion weak-interaction Lagrangian to low energies. This is done using the Nambu–Jona-Lasinio model as a guide. The derivation treats SU(3) breaking from the current-quark mass on an equal footing with the spontaneous chiral-symmetry breaking. It leads naturally to an additional factor of 2–4 enhancement of ΔI=1/2 $K \rightarrow \pi\pi$ decay amplitudes.

52079 **Backgrounds to hadronic Higgs-boson detection in a 1-TeV e^+e^- collider.** Yehudai, E. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309 (USA)). *Physical Review, D (Particles Fields) (USA),* 42(3): 771-776 (1 Aug 1990). DOE Contract AC03-76SF00515.

We calculate the cross section of all standard-model processes which constitute a potential background to the hadronic decays of an intermediate-mass neutral Higgs boson in a 1-TeV e^+e^- collider. These calculations are performed taking into account a realistic photon distribution which is due to beamstrahlung. Imposing appropriate kinematic cuts, and for $m_H > 125$ GeV, the Higgs-boson signal is visible above this background. Distinguishing bottom jets from light-quark jets can greatly enhance the signal-to-noise ratio.

52080 **Higgs-boson production in higher-order electroweak processes at e^+e^- supercolliders.** Barger, V. (Department of Physics, University of Wisconsin, Madison, Wisconsin 53706 (USA)); Han, T.; Stange, A. *Physical Review, D (Particles Fields) (USA),* 42(3): 777-788 (1 Aug 1990). DOE Contract AC02-76ER00881.

We evaluate the production cross sections and some dynamical distributions for the processes $e^+e^- \rightarrow WWH$, $\gamma ZH, ZZH$, and $e^+e^- \rightarrow \nu eWH$, $\nu\bar{\nu}ZH$, $\nu\bar{\nu}\gamma H$. For m_H=25 GeV the cross sections at $\sqrt{s}$ =0.3 TeV are $\sigma(WWH)$=57 fb and $\sigma(\gamma ZH)$=13 fb; for m_H=50 GeV and $\sqrt{s}$ =2 TeV, $\sigma(e\nu WH)$=20 fb and $\sigma(\nu\bar{\nu}\gamma H)$=11 fb. If $m_H < M_Z$, these processes should be measurable at an e^+e^- supercollider with 10 fb^{-1} annual luminosity.

52081 **Towards a systematic jet classification.** Jones, L. (Department of Physics, University of Illinois at Urbana-Champaign, 1110 West Green Street, Urbana, IL (USA)). *Physical Review, D (Particles Fields) (USA),* 42(3): 811-814 (1 Aug 1990). DOE Contract AC02-76ER01195.

A method of classifying hadron jets is presented which uses the z correlations of all hard particles in the jet. We show that this leads to cuts which will allow preparation of "quark-enhanced" samples of jets. Such samples should be useful for computing the W mass in jet-jet invariant-mass distributions, and in searches for new particles which decay predominantly into jets. We urge experiments with e^+e^- data to test these theoretical predictions by comparisons of their "quark-enhanced" and "gluon-enhanced" jet samples.

52082 **Excited-quark and -lepton production at hadron colliders.** Baur, U. (Physics Department, University of Wisconsin, Madison, WI (USA)); Spira, M.; Zerwas, P.M. *Physical Review, D (Particles Fields) (USA),* 42(3): 815-824 (1 Aug 1990). DOE Contract AC02-76ER00881.

The existence of excited states is a natural consequence of composite models for quarks and leptons. Production rates and signatures are discussed for hadron colliders presently operating (CERN Super $p\bar{p}$ Synchrotron and Fermilab Tevatron) or under study (CERN Large Hadron Collider and Superconducting Super Collider). Contact interactions may be an important source for excited fermions and could influence the signatures of such particles significantly. Excited quarks could be discovered with masses up to about 1/3–1/2 of the total collider energy while excited leptons could be accessible up to 1/5–1/3 of the available energy. Large lepton yields are expected if quarks and leptons share common subconstituents.

52083 **Goldstone-boson equivalence theorem and the Higgs resonance.** Valencia, G. (Department of Physics, Brookhaven National Laboratory, Upton, NY (USA)); Willenbrock, S. *Physical Review, D (Particles Fields) (USA),* 42(3): 853-859 (1 Aug 1990). DOE Contract AC02-76CH00016.

The Goldstone-boson equivalence theorem equates the amplitude for longitudinal-vector-boson scattering to the corresponding amplitude for the scattering of the Goldstone bosons of the R_ξ gauge. When the Higgs-boson width is included in the Higgs-boson propagator, this equality is apparently lost. We show that this apparent violation of the theorem is a result of making an inconsistent perturbative expansion of the amplitude. We demonstrate this for the process $W_L^+W_L^- \rightarrow W_L^+W_L^-$ both on resonance ($s=m_H^2$) and far below ($s \ll m_H^2$). We also reformulate the scalar sector of the standard model in such a way that the equivalence theorem is manifestly upheld in the presence of a Higgs-boson width.

52084 **Top-quark backgrounds to Higgs-boson decay to W^+W^-.** Kauffman, R.P. (High Energy Physics Division, Argonne National Laboratory, Argonne, IL (USA)); Yuan, C. *Physical Review, D (Particles Fields) (USA),* 42(3): 956-959 (1 Aug 1990). DOE Contract W-31109-ENG-38.

At the Superconducting Supercollider W-boson pairs coming from $t\bar{t} \rightarrow b\bar{b}W^+W^-$ provide a serious background to the detection

of the Higgs boson through the decay $H \rightarrow W^{+}W^{-} \rightarrow l\nu+2$ jets, a mode crucial to the study of longitudinal Ws in the TeV region. Considering a Higgs-boson mass of 1 TeV and a top-quark mass of 175 GeV we develop a set of cuts which yield a final signal-to-background ratio of approximately 3:1 and about 300 signal events. Most effective are the requirements of lepton isolation and high transverse momentum for the lepton and jets.

52085 (DOE/ER/40209–11) **On gauged Baryon and Lepton numbers.** Rajpoot, S. Wayne State Univ., Detroit, MI (USA). Dept. of Physics and Astronomy. [1990]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER40209. (CONF-9002118–3: 1990 Lake Louise winter institute: the standards model and beyond, Lake Louise (Canada), 18-24 Feb 1990). Order Number DE91000008. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The observation that Baryon number and Lepton number are conserved in nature provides strong motivation for associating gauge symmetries to these conserved numbers. This endeavor requires that the gauge group of electroweak interactions be extended from $SU(2)_L \times U(1)_Y$ to $SU(2)_L \times U(1)_R \times U(1)_{Lepton}$ where $U(1)_R$ couples only to the right-handed quarks and leptons. If it furthur postulated that right-handed currents exist on par with the left-handed ones, then the full electroweak symmetry is $SU(2)_L \times SU(2)_R \times U(1)_{Baryon} \times U(1)_{Lepton}$. The $SU(2)_L \times SU(2)_R \times U(1)_{Baryon} \times U(1)_{Lepton}$ model is described in some detail. The triangle anomalies of the three families of quarks and leptons in the model are cancelled invoking leptoquark matter which is new fermionic matter that carries baryon as well as lepton numbers. In addition to the standard neutral boson (Z °), the theory predicts two neutral gauge bosons with mass lower bounds of 120 GeV and 210 GeV which makes these particles prospective candidates for production at LEP, the TEVATRON and the SSC.

52086 (PHE–86-13, pp. 1-30) **Supersymmetric gauge theories.** Kummer, W. (Technische Hochschule, Vienna (Austria). Inst. fuer Theoretische Physik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The powerful methods of superfields and superspace are extended to general linear gauges in which supersymmetry is not manifest. Such a program is motivated by the fact that (1) the renormalization program for nonabelian super-Yang-Mills fields is well-known to be ill-defined without breaking of supersymmetry in the gauge; (2) it is desireable also to implement 'physical' gauges like the Wess-Zumino gauge, into a superfield formalism. (author).

52087 (PHE–86-13, pp. 46-60) **Supersymmetric quantum mechanics in curved manifold.** Alfaro, V. de (Turin Univ. (Italy). Ist. di Fisica Teorica). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The quantum mechanical model of a supersymmetric particle in curved manifolds is analyzed. First the model is introduced by the superfield formalism. Then the canonical formalism as well as the quantum form for the Hamiltonian and for the quantum operators of supersymmetry are presented and discussed. Finally the implementation of General Coordinate Transformation (GCT) invariance and the connection with Weyl ordering are discussed.

52088 (PHE–86-13, pp. 61-73) **On supersymmetric anomalies.** Garreis, R. (Karlsruhe Univ. (T.H.) (Germany, F.R.)). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

Chiral anomalies occur in supersymmetry which destroy gauge invariance are computed by perturbation field theoretical as well as algebraic methods. The results and the relations between both methods are discussed.

52089 (PHE–86-13, pp. 306-319) **Nonlinear Schroedinger model, Grassmann variable and solitons.** Hruby, J. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu); Bednar, M. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The Grassmann variable is used for the extension of the nonlinear Schroedinger model. The system of coupled non-linear equations is obtained and its one-soliton solution is found. The correspondence to the reflectionless potential in Schroedinger equation is discussed. Korteweg-de Vries equation, Miura transformation, reflectionless potential and supersymmetric quantum mechanics is discussed as well. (author).

52090 (PHE–86-13, pp. 341-345) **Supergeometric interpretation of classical fermion fields.** Schmitt, T. (Akademie der Wissenschaften der DDR, Berlin (German Democratic Republic). Karl-Weierstrass-Inst. fuer Mathematik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

It is proved that approaches with Λ-valued configurations cannot be the proper answer to the question what a classical fermion field is. That's why a program based on supergeometry is presented in order to understand classical fermion fields.

52091 **Sizes of baryon confinement regions.** Brown, G.E. (Dept. of Physics, State Univ. of New York at Stony Brook, Stony Brook, NY (US)). pp. 17-31 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 (CONF-8808196–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

Arguments are presented that R $\geq$ 0.5 fm; more specifically, $\theta(R) = \pi/2$, where $\theta(R)$ is the chiral angle at the bag radius R, is appropriate for quark substructure of the nucleon. This cuts off the boson exchange potential at momentum $\Lambda_{\chi SB} \geq 1$ GeV. For this division, half of the baryon number lies in the interior region and half in the exterior. For strange baryons with little pion cloud to compress the confinement region, R may be 1-1.1 fm as in the M.I.T. bag model. For this radius, a good phenomenology results for magnetic moments. On the other hand, the Callan-Klebanov model, which is also successful, corresponds, as the skyrmion, to R→O.

52092 **Superstrings.** Schwarz, H.H. (California Inst. of Tech., Pasadena, CA (USA)). pp. 50-60 of Proceedings of a symposium on anomalies geometry topology. Bardeen, W.A.; White, A.R. World Scientific Pub. Co., Teaneck, NJ (USA) (1985). pp. 558 (CONF-8503141–: Symposium on anomalies, geometry and topology, Argonne, IL (USA), 28-30 Mar 1985).

This paper surveys the present status of superstring theory. The derivation of the gauge groups SO(32) and $E_8 \times E_8$ is reviewed and the five known superstring theories are described.

52093 **Overview of the Standard Model.** Gilman, F.J. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp. 159-167 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 DOE Contract AC03-76SF00515. (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper discusses the accuracy of the predictions made by the standard Model. The author concentrates on several possible problem areas that are listed.

52094 **Status of CP violation experiments at Fermilab.** Bock, G.J. (Fermilab, Batavia, IL (US)). pp. 132-139 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper presents two preliminary results from *CP* violation experiments at Fermilab. The author concentrates on the ongoing experiment to search for direct CP violation in *K* decay. An experiment searching for *CP* violation in three-pion decay has preliminary limits that are also reported here.

52095 **Signatures of supersymmetry at the CERN collider.** Haber, H.E. (Santa Cruz Inst. for Particle Physics, Univ. of California, Santa Cruz, CA (US)). pp. 185-212 of Test of electroweak theories: Polarized processes and other phenomena. Lynn, B.W.; Verzegnassi, C. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 461 (CONF-8506204–: Workshop on tests of electroweak theories, polarized processes and other phenomena, Trieste (Italy), 10-12 Jun 1985).

This paper presents an analysis of missing energy events at the CERN Collider which would arise from a supersymmetric theory. The rates for gluino and scalar-quark production are computed. It is argued that the monojet events are highly unlikely to come from supersymmetric particle production. This implies very restrictive limits: M_g and M_q must be larger than 60-70 GeV. These conclusions have been obtained assuming that photinos are stable and are the lightest supersymmetric particle. The implications of a Higgsino which is lighter than the photino are also discussed.

52096 **Electroweak interactions at the SSC.** Cahn, R.N. (Lawrence Berkeley Lab., CA (USA)). pp. 173-184 of Test of electroweak theories: Polarized processes and other phenomena. Lynn, B.W.; Verzegnassi, C. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 461 DOE Contract AC03-76SF00098. (CONF-8506204–: Workshop on tests of electroweak theories, polarized processes and other phenomena, Trieste (Italy), 10-12 Jun 1985).

This paper discusses the standard SSC year which will provide roughly 10^9 single gauge boson events, 10^6 double gauge boson events and 104 triple gauge events. There is no known way to identify the hadronic decays of the W and Z so the number of identifiable gauge bosons will be much reduced. Within the simplest version of the orthodox electroweak model, the Higgs boson is an elusive target. If its mass is greater than twice the W mass, it decays into W^+W^- (or ZZ). A standard SSC year will produce about 100,00 Higgs bosons if $M_H = 300$ GeV. The author reports that the only sure signature is from $H \rightarrow ZZ$ with both Z's decaying leptonically. This leaves 120 events before kinematical cuts. This is a pessimistic scenario but a feasible one. The greatest improvement would come from an effective means of identifying gauge by their hadronic decays.

52097 **Anomalies, cocycles and Schwinger terms.** Zumino, B. (Lawrence Berkeley Lab., CA (USA)). pp. 111-128 of Proceedings of a symposium on anomalies geometry topology. Bardeen, W.A.; White, A.R. World Scientific Pub. Co., Teaneck, NJ (USA) (1985). pp. 558 DOE Contract AC03-76SF00098. Grant PHY-81-18547. (CONF-8503141–: Symposium on anomalies, geometry and topology, Argonne, IL (USA), 28-30 Mar 1985).

This paper reviews the properties of cocycles on a gauge group and its Lie algebra and their relationship to gauge anomalies. The case of supersymmetric gauge theories is discussed.

52098 **Future prospects for CP violation.** Morrison, R.J. (Univ. of California, Dept. of Physics, Santa Barbara, CA (US)). pp. 719-738 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

Prospects for observing CP violation in B decays in different experimental environments are discussed. Different energy ranges for e^+e^- colliders, just above the 4s, $\sqrt{s} \approx 25$GeV, and at the Z are compared. Virtual photoproduction at HERA, fixed target hadronic production at the Fermilab, and hadron-hadron colliders at RHIC, the Tevatron, and the SSC are discussed.

52099 **Limits on the masses of supersymmetric particles from 1.8 TeV $\bar{p}$ – p collisions.** Freeman, J. (Fermi National Accelerator Lab., Batavia, IL (US)). pp. 762-773 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

Preliminary analysis of $\bar{p}$ - p collision events at a c.m. energy of 1.8 TeV with large missing transverse energy yields limits on the production cross-section for one-jet events with observed jet transverse energy $E_T > 40$ GeV. For jets in the pseudo-rapidity range $|\eta| < 1.0$, the production cross- section is <0.14 nb. In a minimal supersymmetry model, the mass of the squark must be larger than 84 ± 10 GeV, independent of the mass of the gluino, at the 90% confidence level. The mass of the gluino must be larger than 82 ± 10 GeV, independent of the mass of the squark. The uncertainties are the combined effects of several sources of systematic error in this preliminary result.

52100 **Restrictions on gravitino mass from chiral scalar and pseudoscalar production.** Dicus, D.A. (Center for Particle Theory, University of Texas at Austin, Austin, TX (USA)); Roy, P. *Physical Review, D (Particles Fields) (USA)*, 42(3): 938-940 (1 Aug 1990). DOE Contract FG05-85ER40200.

A lower bound of 5.4×10^{-16} is shown to follow on the gravitino-photino mass ratio from the observed lack of occurrence of the processes $e^+e^- \rightarrow \gamma S, \gamma P$, where *S* and *P* are the nearly massless chiral scalar and pseudoscalar, respectively. For a large class of theories with unified gaugino masses, this is convertible into a lower limit of 6.5×10^{-15} GeV on the gravitino mass.

Bonn Univ. (Germany, F.R.). Physikalisches Inst. Aug 1990. 9p. Source: Available from Bonn Univ. (Germany, F.R.). Physikalisches Inst.

We investigate deformations of two dimensional quasirational conformal field theories through marginal deformations. A recursive representation of the perturbation expansion is found which allows to keep track of the variation of the data of the conformal field theory to arbitrary order. The emerging generalized Kadanoff-Brown criterion for true marginality is discussed. (orig.).

52102 (IC–90/96) **Reduction of 4-dim self dual super Yang-Mills onto super Riemann surfaces.** Mendoza, A. (Universidad Simon Bolivar, Caracas (Venezuela). Dept. de Fisica); Restuccia, A.; Martin, I. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 8p. Order Number DE91602737. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Recently self dual super Yang-Mills over a super Riemann surface was obtained as the zero set of a moment map on the space of superconnections to the dual of the super Lie algebra of gauge transformations. We present a new formulation of 4-dim Euclidean self dual super Yang-Mills in terms of constraints on the supercurvature. By dimensional reduction we obtain the same set of superconformal field equations which define self dual connections on a super Riemann surface. (author). 10 refs.

52103 (IC–90/109) **Partition function for N=2 superstring on the torus.** Aldazabal, G. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche); Allekotte, I.; Bonini, M.; Nunez, C. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 14p. Order Number DE91602735. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A general 1-loop partition function for the 4 dimensional superstring is explicitly constructed as a tensor product of N=2 superconformal theories. Its vanishing is shown by using a generalized Riemann identity. (author). 11 refs.

52104 (IC–90/142) **Gauge-field topology in two dimensions: θ-vacuum, topological phases and composite fields.** Ilieva, N. (International Centre for Theoretical Physics, Trieste (Italy)); Pervushin, V.N. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 16p. Order Number DE91602736. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

In the framework of the minimal quantization method, the residual 'longitudinal' vacuum dynamics of the Abelian gauge field, that is described by a new pair of canonical variables, is revealed. This dynamics is shown to give origin to the θ-vacuum, thus providing a field analogy of the Josephson effect. The destructive interference of the topological phases - that the fermion fields are shown to acquire - is considered as a reason for the charge screening in the two-dimensional massless QED. (author). 11 refs.

52105 (INP–1414/PS, pp. 215-232) **Asymptotic quantization of the electromagnetic field and the resulting inequality for the fine structure constant.** Staruszkiewicz, A (Uniwersytet Jagiellonski, Cracow (Poland). Inst. Fizyki). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

Arguments are presented which allow to derive the inequality $0 < e^2/\hbar c < \Pi$ in a purely phenomenological way i.e. without assumptions about the dynamics of sources of the electromagnetic field. 11 refs. (author).

52106 (ITP–88-121) **Soliton model for elementary electric charge.** Chepilko, N.M.; Kobushkin, A.P. AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Teoreticheskoj Fiziki. 1988. 17p. Order Number DE91602739. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The existence and topological stability of three-dimensional solitons in Klein-Gordon field electrodynamics are proved. The central-symmetric solution to field equations, which can be interpreted as soliton model of elementary electric charge with zero spin, is constructed. The electrostatic soliton rotation is shown to result in the charge having its own magnetic-dipole field. 9 refs.; 2 figs.

52107 (LAFI–145) **Coulomb interaction in the supermultiplet basis.** Ruzha, Ya.Kh.; Guseva, T.V.; Tamberg, Yu.Ya.; Vanagas, V.V. AN Latvijskoj SSR, Riga (USSR). Inst. Fiziki. 1989. 37p. Order Number DE91602740. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

An approximate expression for the matrix elements of the Coulomb interaction operator in the supermultiplet basis has been derived with the account for the orbitally-nonsymmetric terms. From the general expression a simplified formula for the Coulomb interaction energy has been proposed. On the basis of the expression obtained the contribution of the Coulomb interaction to the framework of a strongly restricted dynamic model in the light ($4 \leq A \leq 40$) and heavy ($158 \leq A \leq 196$) nuclei region has been studied. 19 refs.; 4 tabs.

52108 (PHE–86-13, pp. 31-45) **Non-abelian gauge theory in a constant homogeneous background.** Kaiser, H.J. (Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik); Wieczorek, E.; Scharnhorst, K. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

Radiative corrections in constant homogeneous background fields in non-abelian gauge theories are studied beyond the 1-loop approximation. In this frame the gluon propagator in constant homogeneous background fields is derived in form of a modified real Euclidean proper-time representation. The propagator obtained here is better suited to evaluate radiative corrections and to disentangle real and imaginary parts in the effective potential of the gauge field sector. In the resulting expression for the effective potential all the phase factors drop out and the imaginary part can be easily expressed in terms of the renormalized gluon tensor. This finally allows to discuss the physical meaning of the imaginary part from a new point of view.

52109 (PHE–86-13, pp. 74-84) **Phase transition in the infinite-dimensional Z(Q)-symmetric models.** Akheyan, A.Z. (Erevanskij Fizicheskij Inst., Erevan (USSR)); Ananikyan, N.S. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The critical behaviour of the Q-component Potts model on a Bethe lattice is studied. Critical temperatures $T_c^{(1)}$ of the II order phase transition and $T_c^{(2)}$, below which a spontaneous magnetization exists, are found. These temperatures coincide for the ising model Q = 2. Critical exponents β and δ, and also scaling function at $T \approx T_c^{(1)}$ are calculated. The obtained critical exponents confirm the mean field results for the ising model and are $\beta = 1/2$, $\delta = 3$, respectively. Their values are independent of Q. It is shown that pure gauge models have only I order phase transitions, but introducing matter fields, interacting with gauge ones it is possible to obtain the II order transition. (author).

52110 (PHE–86-13, pp. 85-88) **Compact Lie algebras do not admit constant Yang-Mills potentials.** Schimming, R. (Greifswald Univ. (German Democratic Republic)). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

Considering constant gauge potentials over a Euclidean or Lorentzian n-dimensional vector space with values in some compact Lie algebra the Yang-Mills equations force the gauge field to be Abelian. This theorem is proved and applied to the classical Lie algebras as well as to the exceptional compact Lie algebras. Two examples are given. It is concluded that non-Abelian constant Yang-Mills potentials exist if nilpotent Lie algebras are permitted.

52111 (PHE–86-13, pp. 89-100) **Strings in general background fields.** Dorn, H. (Humboldt-Universitaet, Berlin (German Democratic Republic). Sektion Physik); Otto, H.J. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

We give a short review of available methods to derive effective actions describing the massless excitations of strings. Special emphasis is given to the β-function approach and to our own investigations of the open string case within this framework. (author).

52112 (PHE–86-13, pp. 101-120) **Calculation of the static inter-quark potential in the string model in the timelike gauge.** Nesterenko, V.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

Quantum theory of the relativistic string with fixed ends is constructed in the timelike gauge. There are no tachyon states and constraints on the dimension of space-time. The string generates the static interquark potential $V(R) = \sqrt{\gamma^2 R^2} + \epsilon_0$, where ϵ_0 is a free parameter determined in the experiment. (author).

52113 (PHE–86-13, pp. 121-135) **Status of scaling in lattice gauge theory.** Gutbrod, F. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

Recent Monte Carlo results relevant for scaling properties of SU(2) lattice gauge theory are presented. Special emphasis is laid on the scaling violations visible in improved Creutz ratios and in the static qq-bar-potential in SU(2). (author).

52114 (PHE–86-13, pp. 136-146) **Vortices on the two-dimensional lattice.** Grunewald, S. (Humboldt-Universitaet, Berlin (German Democratic Republic). Sektion Physik); Mueller-Preussker, M.; Ilgenfritz, E.M. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

For the 2 D Abelian Higgs model on the lattice we identify (multi-) vortex configurations by relaxation of Monte Carlo equilibrium configuration. (author).

52115 (PHE–86-13, pp. 147-160) **The description of the deuteron as a six-quark system in QCD.** Larin, S.A. (AN SSSR, Moscow (USSR). Inst. Yadernykh Issledovanij); Matveev, V.A. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The QCD sum rule method is applied to studying the mass spectrum of six-quark dibaryon states with quantum numbers of the deuteron. The deuteron mass obtained agrees with the experimental value within the precision of the method. We also study the sum rule for the channel with quantum numbers of the so called virtual level with 'binding energy' $\epsilon = 0.07$ MeV. (author).

52116 (PHE–86-13, pp. 161-168) **Gauge invariance of the first-quantized bosonic string.** Weigt, G. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The gauge invariance of the free closed bosonic quantum string at noncritical dimensions can be seen as a cancellation of anomalies among the string coordinates, the ghosts, and the Liouville field. (author).

52117 (PHE–86-13, pp. 169-183) **Regularized bosonic string theory.** Ambjoern, J. (Niels Bohr Inst., Copenhagen (Denmark)); Durhuus, B. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

A euclidean invariant theory of random surfaces is defined and it is shown how it might be a regulated version of the bosonic string. (author).

52118 (PHE–86-13, pp. 204-205) **Symmetry in stochastic quantification with regularizing noise.** Kirschner, R. (Leipzig Univ. (German Democratic Republic). Sektion Physik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. 52119 (PHE–86-13, pp. 271-291) **Hamiltonian formulation of gauge theories with an explicit solution of the constraint equation.** Ilieva, N.P. (Joint Inst. for Nuclear Research, Dubna (USSR)); Nguyen Suan Han; Pervushin, V.N. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

A gauge-invariant and relativistic-covariant canonical quantization scheme is suggested based on an explicit solution of the constraint equations. The corresponding functional integral is constructed that leads the Green one-particle functions with physically correct (poles) analytical properties. Possible solutions of the problems of gauge ambiguities and quark confinement are discussed in that approach. (author).

52120 (PHE–86-13, pp. 292-305) **Low-energy predictions from modern chiral lagrangians.** Bel'kov, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij); Ebert, D.; Pervushin, V.N. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The structure of modern chiral meson Lagrangians, like the kinetic term, the extended Skyrme term, the symmetry breaking term, and the anomalous Wess-Zumino term, is investigated. The used approach based on a QCD-motivated quark model has the advantage that the normalizations of all meson couplings and decay constants can be fixed. Low-energy predictions of modern quark-based effective Lagrangians are discussed for scattering lengths of pion-pion and pion-kaon scattering, the decay $\eta' \to \eta 2\pi$ and the vector form factor of K_{l4} decay. The agreement with experiments is generally encouraging.

52121 (PHE–86-13, pp. 346-351) **BRST cohomology for SU(2) Yang-Mills theory developed around a BPST instanton.** Muelsch, D. (Leipzig Univ. (German Democratic Republic). Sektion Physik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The study show how the horizontality method for obtaining BRST transformations rules and an invariant motion may be applied to the case of SU(2) Yang-Mills theory developed around a BPST instanton solution in Euclidean four-space M. In this way, the anomalies can be found non-perturbatively using recently introduced methods which provide a systematic algorithm for computing anomalies.

52122 (PHE–86-13, pp. 352-360) **The Gaussian effective potential.** Pohle, H.J. (Leipzig Univ. (German Democratic Republic). Sektion Physik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

Nonlinear field theoretical models are studied by means of variational methods. The results obtained from these variational calculations are generalized and renormalized by the help of the Gaussian effective potential. This method is applied to ϕ^4-field theory and to pure Yang-Mills theory.

52123 (PHE–86-13, pp. 361-382) **The confusion mechanism and the heterotic string.** Bennett, D.L. (Royal Danish College of Pharmacy, Copenhagen (Denmark)); Nielsen, H.B.; Brene, N.; Mizrachi, L. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

The confusion mechanism introduced earlier in connection with the gauge glass model is here discussed in the context of field theories involving symmetry groups which have outer automorphisms. The heterotic string with an $E_8 \times E_8$ symmetry may be influence by confusion with the result that only one E_8 group survives and the shadow world disappears. (author).

52124 (PHE–86-13, pp. 383-393) **Number of generations related to coupling constants by confusion.** Bennett, D.L. (Royal Danish College of Pharmacy, Copenhagen (Denmark)); Nielsen, H.B.; Picek, I. Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

In the context of random dynamics, the mechanism of confusion is used to obtain a relation between the number of generations and standard model coupling constants. Preliminary results predict the existence of four generations. (author).

52125 (PHE–86-13, pp. 394-405) **Reduction of coupling and its application.** Sibold, K. (Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the theory of elementary particles.* 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

After explaining the concept of reduction of couplings we present results of two important applications. One is reduction in the standard model, the other is a finiteness criterion in supersymmetric Yang-Mills theories. (author).

52126 **Quarks and the spin of the proton for pedestrians.** Lipkin, H.J. (Dept. of Nuclear Physics, Weizmann Institute of Science, Rehovot 76100 (IL)). pp. 54-58 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

The analysis of the EMC result on the quark contribution to the spin of the proton has caused considerable confusion and is unnecessarily complicated because of the use of SU(3) flavor symmetry to provide input on the proton wave function from hyperon decays. The basic physics can be seen by noting a clear inconsistency between the known result of the axial vector contribution to nucleon beta decay and the conventional quark-parton interpretation of the EMC result.

52127 **Resonance photo and electroproduction as a probe of QCD.** Close, F.E. (Oak Ridge National Lab., Oak Ridge, TN (US)). pp. 67-85 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 DOE Contract AC05-84OR21400. (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

Analogies have been drawn between QCD where quarks build up hadrons, which in turn build up nuclei, and QED where electrons build up atoms, which in turn build up molecules. The author discusses the issue of creating a quark theory of the nucleus in QCD by analogy with the way electrons build up molecules in QED. In QED the first step has been achieved, namely understanding atoms in terms of their electronic structure, but molecular structure in QED is only understood in rather simple cases. In QCD the situation is even worse, in that researchers haven't even achieved the first step, namely in understanding how hadrons are built from quarks.

52128 **Indirect searches for very heavy quarks.** Bigi, I.I. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp. 75-81 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The N.Y. Academy of Sciences, New York, NY (USA) (1987). pp. 365 DOE Contract AC03-76SF00515. (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper discusses the history of K decay studies and their indications that new physics can be found in an indirect way. An understanding of the B meson wave function is presented.

52129 **Experimental review of exclusive processes in two photon reactions.** Ronan, M.T. (Lawrence Berkeley Lab., Berkeley, CA (US)). pp. 51-80 of Proceedings of the VIIth international workshop on photon-photon. Courau, A.; Kessler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 485 DOE Contract AC03-76SF00098. (CONF-8604238–: 7. international workshop on photon-photon collisions, Paris (France), 1-5 Apr 1986).

Recent experimental results on exclusive final states produced in photon-photon interactions are reviewed. Comparisons between experiments and with perturbative QCD calculations are made for meson and baryon pair production. New results on vector meson pair production and production of multiparticle final states are summarized.

52130 **Two-photon exclusive processes in quantum chromodynamics.** Brodsky, S.J. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp. 81-100 of Proceedings of the VIIth international workshop on photon-photon. Courau, A.; Kessler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 485 DOE Contract AC03-76SF00515. (CONF-8604238–: 7. international workshop on photon-photon collisions, Paris (France), 1-5 Apr 1986).

QCD predictions for $\gamma\gamma$ annihilation into single mesons, meson pairs, and baryon pairs are reviewed. Two-photon exclusive processes provide the most sensitive and practical measure of the distribution amplitudes, and thus a critical confrontation between QCD and experiment. Both the angular distribution and virtual photon mass dependence of these amplitudes are sensitive to the shapes of the $\phi(x,Q)$. Novel effects involving the production of $qq\bar{q}$ states at threshold are also discussed, and a new method is presented for systematically incorporating higher-order QED corrections on $\gamma\gamma$ reactions.

52131 Eta photoproduction in the S11 region. Benmerrouche, M. (Dept. of Physics, Rensselaer Polytechnic Institute, Troy, NY (US)); Mukhopadhyay, N.C. pp. 199-204 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

The eta photoproduction reaction is analyzed with a view to examine the γNS_{11} resonant amplitude. The role of the nonresonant background is emphasized. The analysis is based on the effective Lagrangian formalism and includes contributions form the s- and u-channel nucleon, t-channel vector meson and s- and u- channel S_{11} resonance exchanges. As in the case of πo photoproduction, there is a large difference between pseudoscalar (PS) and pseudovector (PV) nucleon Born terms and the ρ and ω contributions can be substantial. The authors discuss the E_{0+} (E1) amplitude and the corresponding partial cross-section. The results are compared with the isobar model analysis.

52132 Dynamics of symmetry breaking in strong coupled QED. Bardeen, W.A. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 110-126 of New trends in strong coupling gauge theories. Bando, M.; Muta, T.; Yamawaki, K. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 350 (CONF-8808309–: International workshop on new trends in strong coupling gauge theories, Nagoya (Japan), 24-27 Aug 1988).

The author reviews the dynamical structure of strong coupled QED in quenched, planar limit. The symmetry structure of this theory is examined with reference to the nature of both chiral and scale symmetry breaking. The renormalization structure of the strong coupled phase is analyzed. The compatibility of spontaneous scale and chiral symmetry breaking is studied using effective Lagrangian methods.

52133 A new phase of QED and narrow peaks in heavy-ion collisions. Caldi, D.G. (Connecticut Univ., Storrs, CT (USA). Dept. of Physics). pp. 198-205 of New trends in strong coupling gauge theories. Bando, M.; Muta, T.; Yamawaki, K. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 350 (CONF-8808309–: International workshop on new trends in strong coupling gauge theories, Nagoya (Japan), 24-27 Aug 1988).

The authors review the experimental evidence for narrow peeks in e^+e^- coincidence data from low-energy collisions of heavy ions and various theoretical explanations. They concentrate on the scenario that the narrow peaks are well explained by composite states of e^+e^- in a new phase of QED with chiral symmetry spontaneously broken. Evidence for a new phase lattice and continuum studies is discussed, as well as the question of whether background fields can induce the phase transition. The spectrum obtained from a strong-coupling calculation in the new phase is given, which agrees well with the experimental peaks. A model for gamma-ray busts based on the new phase is also discussed.

52134 Fourth-family quark masses and the Kobayashi-Maskawa phenomenology from the regularities in the structure of quark mass matrices. Shin, M. (Physics Dept., Brown Univ., Providence, RI (US)). pp. 116-121 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper discusses the theoretical expectations on the hypothetical fourth-family of quarks implied by the regularities present in the quark mass matrices. In the meantime, The author encourages colleagues with theoretical predilections to test the KM mixing angles predicted by the structures presented by applying them to all aspects of KM phenomenologies, and narrow down the allowed mass ranges (m_b, m_t). A review is offered on two recent theoretical ides that successfully relate the observed KM angles to the quark mass ratios.

52135 Constraints and speculations on fourth-generation physics. Marciano, W.J. (Physics Dept., Brookhaven National Lab., Upton, NY (US)). pp. 180-185 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper describes some low-energy constraints on the properties of a fourth-generation and point out some implications it might have for neutrino oscillations. The author gives some results of a recent global analysis of weak neutral current phenomenology that provide constraints on fourth-generation masses. Bounds on fourth-generation quark mixing from charged current unitarity are surveyed. The author speculates about some properties a fourth-generation neutrino might exhibit, with emphasis on neutrino oscillations in matter.

52136 Holonomy anomalies. Bagger, J. (Lyman Lab. of Physics, Harvard Univ., Cambridge, MA (US)); Nemeschansky, D.; Yankielowicz, S. pp. 197-204 of Proceedings of a symposium on anomalies geometry topology. Bardeen, W.A.; White, A.R. World Scientific Pub. Co., Teaneck, NJ (USA) (1985). pp. 558 DOE Contract AC03-76SF00515. Contract NSF-PHY-82-15249. (CONF-8503141–: Symposium on anomalies, geometry and topology, Argonne, IL (USA), 28-30 Mar 1985).

This paper gives a unified picture of sigma model anomalies. The authors show how the anomalies can be canceled by Chern-Simons terms built out of appropriate connections w^1. When generalized 't Hooft conditions are satisfied, the Chern-Simons term can be pulled back to an integral over spacetime, and the effective action is well-defined.

52137 A physical interpretation of the 3rd cocycle in the group cohomology of nonAbelian gauge theories. Grossman, B. (Rockefeller Univ., New York, NY (USA)). pp. 169-176 of Proceedings of a symposium on anomalies geometry topology. Bardeen, W.A.; White, A.R. World Scientific Pub. Co., Teaneck, NJ (USA) (1985). pp. 558 (CONF-8503141–: Symposium on anomalies, geometry and topology, Argonne, IL (USA), 28-30 Mar 1985).

This paper discusses how the extension of the loops in the quotient bundle by loops in the group Ω is related to a possible string theory extension of gauge theories. The central extensions of the loops in the Lie algebra are classified by the Kac-Moody Lie algebras whose representations determine string theories. These exponentiate to a group when the coefficient of the central extension satisfies a quantization condition. The author reports that this could perhaps be obtained by quantizing the stringlike singularities between magnetic monopoles with 1/N times the usual Dirac charge.

52138 Color magnetism and delta photoproduction. Mukhopadhayay, N.C. (Dept. of Physics, Rensselaer Polytechnic Institute, Troy, NY (US)). pp. 205-234 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

Just as the spectroscopy of atomic levels teaches us about the quantum electrodynamics, the dynamics of interaction between the leptons and the nucleus, so is the spectroscopy of excited baryons a powerful tool to study quantum chromodynamics (QCD), the dynamics of interacting quarks and gluons that make hadrons. One of the most prominent of these excited baryons is the delta (1232) resonance. The progress made in the electromagnetic excitation of this resonance over three decades is summarized, with emphasis on the recent progress in the ways of extracting the nucleon to delta electromagnetic transition amplitudes from existing experiments on photoproduction of pions.

52139 Problems of describing spin −3/2 baryon resonances in the effective lagrangian theory. Davidson, R.M. (Dept. of

Physics, Rensselaer Polytechnic Institute, Troy, NY (US)); Benmerrouche, M.; Mukhopadhyay, N.C. pp. 293-297 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

The authors investigate several theoretical issues associated with the treatment of the spin - 3/2 baryons in the effective Lagrangian theory. These are: form of the spin - 3/2 particle propagator; off-shell parameters involving the spin - 3/2 field; strategies of implementing gauge invariance; unitarity. They comment on previous works. The authors' experience on the delta (1232) resonance is invoked as a concrete example of dealing with these problems. Examples of some related problems appear in theories of massive vector and spin - 3/2 particles, in pion decay and supersymmetry respectively.

52140 Dijet angular distribution and multijet topology at square root of s = 1.8 TeV. Patrick, J.F. (Fermi National Accelerator Lab., Batavia, IL (US)). pp. 217-226 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

The distribution in center of mass scattering angle θ^* of the jets in two jets events and of the leading jet in 3 jet events has been measured in proton - antiproton collisions at square root s = 1.8 TeV using the CDF detector at the Fermilab Tevatron Collider. The results are compared to QCD predictions. A preliminary study of the topology of 4 jet events has been made. The data has been compared 4 jet events generated by ISAJET and to a model for multiparton scattering constructed by merging 2 jet events generated by ISAJET.

52141 Classical geometrical interpretation of ghost fields and anomalies in Yang-Mills theory and quantum gravity. Thierry-Mieg, J. (Lawrence Berkeley Lab., CA (USA)). pp. 239-246 of Proceedings of a symposium on anomalies geometry topology. Bardeen, W.A.; White, A.R. World Scientific Pub. Co., Teaneck, NJ (USA) (1985). pp. 558 (CONF-8503141–: Symposium on anomalies, geometry and topology, Argonne, IL (USA), 28-30 Mar 1985).

This paper discusses the reinterpretation of the BRS equations of Quantum Field Theory as the Maurer Cartan equation of a classical principal fiber bundle leads to a simple gauge invariant classification of the anomalies in Yang Mills theory and gravity.

52142 Aspects of superstring theory. Green, M.B. (California Inst. of Tech., Pasadena, CA (USA)). pp. 263-275 of Proceedings of a symposium on anomalies geometry topology. Bardeen, W.A.; White, A.R. World Scientific Pub. Co., Teaneck, NJ (USA) (1985). pp. 558 (CONF-8503141–: Symposium on anomalies, geometry and topology, Argonne, IL (USA), 28-30 Mar 1985).

This paper outlines features of superstring theories which have arisen in the course of their development. These include: a discussion of the covariant action that describes the classical dynamics of a superstring in a geometrical manner; an outline of lightcone-gauge superstring field theory with an explanation of the absence of higher-order contact interactions in superstring theories; and a derivation of Yang-Mills field theory as the low-energy limit of the field theory of open superstrings directly from the stringfield action.

52143 The strongly coupled standard model. Farhi, E. (Massachusetts Inst. of Tech., Cambridge, MA (USA). Center for Theoretical Physics). pp. 326-330 of New trends in strong coupling gauge theories. Bando, M.; Muta, T.; Yamawaki, K. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 350 (CONF-8808309–: International workshop on new trends in strong coupling gauge theories, Nagoya (Japan), 24-27 Aug 1988).

This paper reports on the strongly coupled standard model or SCSM. The author emphasizes the dynamical assumptions which must be in order for this model to work. The model begins with the standard weak interaction Lagrangian based on $SU(2)_L \times U(1)_Y$.

52144 The CDF direct photon analysis. Blair, R. (Argonne National Lab., Argonne, IL (US)). pp. 361-371 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

Using data from $\bar{p}p$ collisions observed in the CDF detector at square root s of 1.8TeV, a sample of events are selected which have calorimetry and tracking consistent with a single isolated photon produced in the central rapidity range $(-.9<\eta<.9)$ with $P_T>15$GeV. In the P_T range below 30 GeV, the lateral shape of the shower measured at 6 radiation lengths is used to evaluate the fraction of events which are actually isolated neutral hadrons. The photon cross section versus P_T is compared with that expected from QCD plus lower energy collider measurements.

52145 Are fourth-generation quarks integrally charged. Pakvasa, S. He, X.G. (Dept. of Physics and Astronomy, Univ. of Hawaii at Manoa, Honolulu, HI (US)); Sugawara, H. pp. 332-336 of The fourth family of quarks and leptons: Volume 518. Cline, D.B.; Soni, A. The New York Academy of Sciences, New York, NY (USA) (1987). pp. 365 (CONF-870278–: 1. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (USA), 26-28 Feb 1987).

This paper reviews a novel way of implementing generation symmetry before grand unification in which the unification scale can be as high as the Planck scale (and the correct $\sin^2\theta_W$ prediction is preserved). The authors state that in the simplest model of this kind, corresponding to a low-energy gauge group $SU(2)_L \times SU(2)_R \times SU(3)_c \times SU(4)_G$, there are striking experimental signatures from production and decay of integer-changed fourth-generation quarks. They describe the consequences of a scheme in which the gauge is enlarged to $SU(2)_L \times SU(2)_R \times SU(3)_c \times SU(5)_G$ and the fourth-generation quarks are normal (while the fifth-generation quarks carry charges (−1/6, −7/6)).

52146 Production and phenomenology of glueballs. Chan, C.S. (City College of New York, New York, NY (US)); Lindenbaum, S.J. pp. 439-470 of Excited Baryons 1988. Adams, G.; Mukhopadhyay, N.C.; Stoler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1989). pp. 565 (CONF-8808198–: Topical workshop on excited baryons, Troy, NY (USA), 4-6 Aug 1988).

After a brief introduction, the current status of the prominent glueball candidates are reviewed. In particular, the authors present a partial wave analysis of 6658 events of the reaction $\pi^-p \rightarrow \phi n$ at 22 GeV/c. The data analysis reveals three resonances $_{gT}(2010)$, $_{gT'}(2300)$ and $_{gT''}(2340)$, all with the same quantum numbers $I^GJ^{PC} = 0^+2^{++}$ which comprise virtually all the production cross section.

52147 Top quark mass in grand unified theories with intermediate scales. Shafi, Q. (Delaware Univ., Newark, DE (USA). Bartol Research Foundation). pp. 458-459 of Test of electroweak theories: Polarized processes and other phenomena. Lynn, B.W.; Verzegnassi, C. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 461 (CONF-8506204–: Workshop on tests of electroweak theories, polarized processes and other phenomena, Trieste (Italy), 10-12 Jun 1985).

This paper discusses the relation which predicts a top quark mass close to 40 GeV and is derived in the context of SO(10)(and E_6) grand unified theories with suitable intermediate scales.

52148 Applications of amplitude factorization to γ production of vector meson pairs. Brodsky, S.J. (Stanford Linear Accelerator Center, Stanford Univ., CA (US)); Meshkov, S. pp. 462 of Proceedings of the VIIth international workshop on photon-photon. Courau, A.; Kessler, P. World Scientific Pub. Co., Teaneck, NJ (USA) (1986). pp. 485 (CONF-8604238–: 7. international workshop on photon-photon collisions, Paris (France), 1-5 Apr 1986).

A crossing symmetric description of the $\gamma\gamma$ production of $\rho^0\rho^0$ and other vector meson pairs is formulated. The authors use light cone extension of the Yennie shrinking photon slope parameterization of electroproduction and threshold photoproduction which interpolates between QCD pointlike behavior and VMD. The model predicts a flat $\cos\theta_{CM}$ production distribution near threshold for $\gamma\gamma \rightarrow \rho^0\rho^0$. The distribution becomes forward peaked as $W_{\gamma\gamma}$ increases.

52149 Effective actions, decoupling and anomalies in chiral gauge theories. D'Hoker, E. (Columbia Univ., New York, NY

(USA). Dept. of Physics); Farhi, E. pp. 477-482 of Proceedings of a symposium on anomalies geometry topology. Bardeen, W.A.; White, A.R. World Scientific Pub. Co., Teaneck, NJ (USA) (1985). pp. 558 (CONF-8503141–: Symposium on anomalies, geometry and topology, Argonne, IL (USA), 28-30 Mar 1985).

This paper shows that the Wess-Zumino term is a calculable consequence of decoupling a fermion in a chiral gauge theory. An anomaly free theory remains gauge invariant after decoupling a fermion. Decoupling alters the statistics and quantum numbers of stable solitons. The authors state that if originally no stable solitons are present, decoupling may create stable solitons.

52150 **Fractional charge in a nut-shell.** Boyanovsky, D. (Stanford Univ., CA (USA)); Blankenbecler, R. pp. 427-433 of Proceedings of a symposium on anomalies geometry topology. Bardeen, W.A.; White, A.R. World Scientific Pub. Co., Teaneck, NJ (USA) (1985). pp. 558 (CONF-8503141–: Symposium on anomalies, geometry and topology, Argonne, IL (USA), 28-30 Mar 1985).

This paper presents a study of physics of charge fractionalization using simple methods. The strategy is to count the number of states of the theory will solitons relative to the same theory with trivial background fields. The interplay between high and low energy contributions is exposed and the topological properties clarified.

52151 **Heavy quark production at collider energies.** Ellis, R.K. (Fermi National Accelerator Lab., Batavia, IL (US)). pp. 639-660 of Proceedings of the 7th topical workshop on proton-antiproton collider physics. Raja, R.; Tollestrup, A.; Yoh, J. World Scientific Pub. Co., Teaneck, NJ (USA) (1988). pp. 885 (CONF-8806232–: 7. topical workshop on proton-antiproton collider physics, Batavia, IL (USA), 20-24 Jun 1988).

The author reviews the theory of heavy quark production in QCD at collider energies. The most important features of the recently published results on higher order corrections to the heavy quark production cross- section are described. The phenomenological consequences of these formulae for bottom and top quark production at SpρS and Tevatron energies are presented.

52152 **Convergence radius of chiral perturbation theory in the large-N_c limit.** Hatsuda, T. (Department of Physics, State University of New York at Stony Brook, Stony Brook, NY (USA)). *Physical Review Letters (USA),* 65(5): 543-546 (30 Jul 1990). DOE Contract FG02-88ER40388.

By using a dynamical model of chiral-symmetry breaking, we demonstrate that the chiral perturbation expansion around the $SU_f(3)$-symmetric vacuum does not converge in the large-N_c limit. The convergence radius of the expansion in the strange-quark mass m_s is shown to be 30–50 MeV, which means that higher-order terms become larger as one increases the order of the expansion in the physical region (m_s~150 MeV). The first-order mass formula for the Nambu-Goldstone bosons turns out to be accidentally valid in the physical region.

52153 **$E(1420)$ meson as a $K\bar{K}\pi$ molecule.** Longacre, R.S. (Brookhaven National Laboratory, Upton, NY (USA)). *Physical Review, D (Particles Fields) (USA),* 42(3): 874-883 (1 Aug 1990). DOE Contract AC02-76CH00016.

In this article an experimental summary of the $E(1420)$ meson with $J^{PC}=1^{++}$ is presented and it is argued that the $E(1420)$ is not explained by QCD in terms of being a fundamental arrangement of quarks and gluons. We then develop a final-state rescattering mechanism based on one-particle-exchange Born terms. We sum these Born terms through a Fredholm integral equation and obtain a Fredholm determinant which shows an enhancement at the $E(1420)$ with $J^{PC}=1^{++}$. The subsequent sum of Born terms is analogous to a π orbiting in a p wave around an s-wave $K\bar{K}$ system. This represents the first example of a molecular state which is bound by color-singlet particle exchanges, as opposed to work by Weinstein and Isgur, which uses color forces to bind their molecule. A phenomenological analysis of all the latest $K\bar{K}\pi$ data arising from hadroproduction argues that the molecular picture for the $E(1420)$ is consistent. We show that if the molecular nature for the $E(1420)$ is generated by the above final-state Born terms, an exotic $K^+\bar{K}_0K^+$ $J^P=0^-$ molecule must exist at the $K\bar{K}K$ threshold.

52154 **Field-theory calculations of the pion mass to one-loop order.** Hakioglu, T. (Department of Physics, University of Arizona, Tucson, AZ (USA)); Scadron, M.D. *Physical Review, D (Particles Fields) (USA),* 42(3): 941-944 (1 Aug 1990).

We compute the pion mass to one-loop order in the SU(2) linear σ and four-fermion model field theories both in terms of the non-strange current-quark mass $\hat{m}_{cur}$. The answers in these two chiral-symmetry schemes are the same and predict $\hat{m}_{cur}\approx 34$ MeV for two quark flavors.

We review the most recent data from Experiments 802, 810 and 814 of the heavy-ion program at the Brookhaven Alternating Gradient Synchrotron (AGS).

52156 (DOE/ER/40150–134) **Physics program in Hall A at CEBAF.** Saha, A. Southeastern Universities Research Association, Newport News, VA (USA). Continuous Electron Beam Accelerator Facility. [1990]. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84ER40150. (CEBAF-PR–90-002). Order Number DE91000428. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

We present here the physics program planned for Hall A at CEBAF. It encompass exclusive as well as inclusive electromagnetic measurements requiring both high precision and accuracy. The program includes measurements of the elementary form factors of the nucleon, systematic studies of the few nucleon systems (d, ^{3,4}He), high momentum structure of nuclei, their structure at high Q^2 to look for hadronization and quark effects, spin response of nuclei via $(\vec{e}, e'\vec{p})$ reactions and the study of nuclear pion fields.

The main theme of this report is the study and interpretation of the sequence of events that occur during the collisions of nuclear particles. Some of the processes discussed in parts A and B involve short range interactions; others involve interactions of long range. In most of part A one of the particles in the initial or in the final state (or in both) is a photon, which serves as a probe of the second particle, which may be a nucleus, a proton, a pion or any other hadron. The complexity of the processes taking place during the collisions makes it necessary to simplify some aspects of the physical problem. This leads to the introduction of modals which are used to describe a limited number of features in as much detail as possible. The main interest is the understanding of the hadronic excitations which result from the absorption of a photon and the determination of the fundamental structure constants of the target particle. In part B, all the particles are hadrons. The purpose here is to develop and apply optimal quantal methods appropriate for describing the interacting systems. Of particular interest are three-particle collision systems in which the final state consists of three free particles. Part B also considers the process of nuclear fusion as catalyzed by bound muons.

52161 (DOE/ER/40403–T2) **Experimental studies of nucleon-nucleon and pion-nucleus interactions at intermediate energies: Progress report, April 1, 1988–March 31, 1991.** New Mexico State Univ., Las Cruces, NM (USA). 1 Oct 1990. 54p. Sponsored by U.S. DOE Energy Research. DOE Contract FG04-88ER40403. Order Number DE91000605. Source: NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

This report summarizes the work on experimental research in intermediate energy nuclear and particle physics carried out by New Mexico State University in 1988–91. Most of these studies have involved investigations of neutron-proton and pion-nucleus interactions. The neutron-proton research is part of a program of studies of interactions between polarized nucleons that we have been involved with for more than ten years. Its purpose has been to help complete the determination of the full set of ten complex nucleon-nucleon amplitudes at energies up to 800 MeV, as well as to continue investigating the possibility of the existence of dibaryon resonances. The give complex isospin-one amplitudes have been fairly well determined, partly as a result of this work. Our work in this period has involved measurements and analysis of data on elastic scattering and total cross sections for polarized neutrons on polarized protons. The pion-nucleus research continues our studies of this interaction in regions where it has not been well explored. One set of experiments includes studies of pion elastic and double-charge-exchange scattering at energies between 300 and 550 MeV, where our data is unique. Another involves elastic and single-charge-exchange scattering of pions from polarized nuclear targets, a new field of research which will give the first extensive set of information on spin-dependent pion-nucleus amplitudes. Still another involves the first set of detailed studies of the kinematic correlations among particles emitted following pion absorption in nuclei.

52162 (GSI–90-36(prepr.)) **Reactions at tens of MeV/u and a few GeV/u: Differences and similarities.** Henning, W. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Jul 1990. 20p. (CONF-9004248–: 2. IN2-P3-RIKEN symposium on heavy-ion collisions, Obernai (France), 9-13 Apr 1990). Order Number DE91706319. Source: NTIS (US Sales Only), PC A03/MF A01.

The increased interest in heavy-ion physics at GeV/u energies is still paralleled by intensive research at energies closer to the barrier up to tens of MeV/u. The new heavy-ion facility at GSI, consisting of the improved UNILAC and a new 2 GeV/u synchrotron SIS and the experimental storage ring ESR allow heavy-ion studies over the full energy range. An attempt is made to summarize the research proposals for these facilities in light of the differences and common aspects between the various energy regimes. (orig.).

52163 (INP–1414/PS, pp. 133-144) **Production and spectroscopy of nuclei far from stability line. Recent results obtained at the GSI on-line mass separator.** Klepper, O. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.)). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The mass-separator on-line to the heavy-ion accelerator UNILAC at GSI Darmstadt is presented. The main features of this facility are briefly described, in particular the recent development of an ion source with bunched beam release, and results from recent decay-spectroscopic measurements of mass-separated samples are given. Using fusion-evaporation reactions with ^{40}Ca and ^{58}Ni projectiles, proton-rich nuclei are studied in the fp shell, "southeast" of ^{100}Sn and "northwest" of ^{146}Gd. The comparison of the measured GT beta-decay strength may yield systematic (mass dependent) information on the quenching of proton-to-neutron transitions between spin-orbit partners in the f,g and h shells. By determining low-lying single-proton states and associated single-particle energy separations, the systematics of the N=82 single-particle energy gap beyond Z=64 is extended up to Z=69. Neutron-rich nuclei are produced and investigated over a wide range of elements between chromium and actinium using (9-15) MeV/u beams between ^{76}Ge and ^{238}U. The measured beta decay half-lives in the iron region are considerably shorter than predicted by current models. New theoretical approaches to overcome this deficiency and also the possible influence of these shorter half-lives on r-process calculations are discussed. Collinear laser spectroscopy is applied to systematically determine isotope shifts and moments for long chains of isotopes in the tin and lead region. 60 refs., 6 figs. (author).

52164 (INP–1414/PS, pp. 163-172) **"Δ"s in nuclei.** Ellegaard, C. (Niels Bohr Inst., Copenhagen (Denmark)). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The excitation of Δ resonances in the charge exchange (^{3}He, t), (d-vector, ^{2}He) and heavy ion reactions are examined. 14 refs., 12 figs. (M.F.W.).

52165 (INP–1414/PS, pp. 307-308) **Delta excitation in charge exchange reactions with heavy ions.** Million, B. (Niels Bohr Inst., Copenhagen (Denmark)). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number

DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The charge-exchange reactions induced by heavy ions are studied. The (p,n) and (n,p) channels are compared. (M.F.W.).

52166 (JAERI-M–90-098) **Premonochromator characteristics of Si and Ge crystals for nuclear Bragg scattering.** Harami, Taikan (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1990. 83p. Order Number DE91713053. Source: NTIS (US Sales Only), PC A05/MF A01.

The use of monochromator plays an important role as monochromatizing the photon from a facility having an electron storage ring to a narrow band width about the wavelength determined by the Bragg condition. This paper describes the dynamical diffraction formulae and collects the characteristics data of premonochromators of Si and Ge crystals for nuclear Bragg scattering. The numerical studies show the following data. (1) Reflectivity, Bragg reflection width, energy resolution and integral reflecting power for the various reflections of Si and Ge crystals at the photon with the resonance excitation energy of the Moessbauer nuclei of ^{181}Tm(6.21 keV), ^{169}Tm(8.42 keV), ^{57}Fe(14.41 keV), ^{119}Sn(23.87 keV) and ^{238}U(44.70 keV). (2) Tables of susceptibilities and figures of rocking curves for the various reflections of Si and Ge crystals. (author).

52167 (LBL–29445) **Transuranium elements: A half century.** Seaborg, G.T. Lawrence Berkeley Lab., CA (USA). Aug 1990. 69p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-900846–2: International symposium to commemorate the 50th anniversary of discovery of transuranium elements, Washington, DC (USA), 26-31 Aug 1990). Order Number DE91000226. Source: NTIS, PC A05/MF A01; OSTI; INIS; GPO Dep.

This report discusses the discovery of all transuranium elements over the past fifty years. (LSP)

52168 (ORNL/FTR–3733) **[Work on the L* experiment]: Foreign trip report, August 15, 1990–August 31, 1990.** Plasil, F. Oak Ridge National Lab., TN (USA). 10 Sep 1990. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE91000387. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler spent eleven intense days at CERN, Switzerland. His time was divided between daytime, when he worked mainly on L* issues, and evenings/nights, when he performed shift work during the current run of the WA80 collaboration. It was decided to reduce the size and cost of the proposed L* experiment. Strategy for SSC subsystem proposals was discussed, and several relevant decisions were made.

52169 (ORNL/FTR–3743) **[The 1990 run of the WA80 experiment]: Foreign trip report, July 26–September 4, 1990.** Young, G.R. Oak Ridge National Lab., TN (USA). 18 Sep 1990. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE91000386. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler spent six weeks at CERN participating in the 1990 run of the WA80 experiment. The traveler concentrated on trigger electronics for the first two weeks and on operation of the experiment for much of the next four. New electronics designed at ORNL for reading out the new BGO spectrometer were tested with the BGO in beam. Improvements were made, in collaboration with the ORNL engineers who designed the electronics. Plans were made for constructing the electronics in large quantities. Conversations were had with other members of WA80 about the analysis of results from this year's run and our plans for the 1991/1992 runs proposed for CERN. Lengthy conversations were had about the draft of a first paper concerning limits on direct photon production. Finally, the traveler attended an all-day session of the dilepton working group chartered to consider dilepton and photon experiments using heavy-ion beams in CERN's to-be-proposed Large Hadron Collider (LHC). At this meeting the traveler presented recent results from the group working on such a proposal for RHIC and updated his earlier presentation of June 1990 in this working group.

52170 (UCRL-JC–104781) **J/ψ suppression: Catching up with the comovers.** Vogt, R. (Lawrence Livermore National Lab., CA (USA)); Gavin, S. Lawrence Livermore National Lab., CA (USA). 27 Aug 1990. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (HU-TFT–90-57;CONF-900570–12: 8. international conference on ultrarelativistic nucleus-nucleus collisions: Quark Matter '90, Menton (France), 7-11 May 1990). Order Number DE91000811. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The combined role of inelastic scattering with nucleons and comoving secondary particles in J/ψ suppression is explored. An analysis of the latest FNAL and CERN data suggests that the high-density comover contribution emerges with increasing incident energy and A.

6511 Experimental Techniques

52171 (LA-UR–90-3253) **Bayesian spectral analysis of reflectivity data.** Sivia, D.S.; Hamilton, W.A.; Smith, G.S. Los Alamos National Lab., NM (USA). [1990]. 5p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9007172–1: MAXENT '90: maximum entropy workshop, Laramie, WY (USA), 30 Jul - 3 aug 1990). Order Number DE91000215. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The analysis of neutron and x-ray reflectivity data to obtain scattering-length density profiles is akin to the notorious phaseless Fourier problem, well-known in many fields such as crystallography. Current methods of analysis culminate in the refinement of a few parameters of a functional model, and are often preceded by a long and laborious process of trial-and-error. A discussion of the use of maximum entropy for obtaining "free-form" solutions of the density profile, as an alternative to the trial-and-error phase when a functional model is not available, and the suggestion for a novel experimental procedure designed to alleviate the ambiguity problems inherent in traditional reflectivity measurements, are given in Sivia et al. (1990). In this paper we consider the Bayesian spectral analysis approach, which is appropriate for optimising the parameters of a simple (but adequate) type of model when the number of parameters is not known. 8 refs., 3 figs.

52172 (LA-UR–90-3346) **High resolution inelastic gamma-ray measurements with a white neutron source from 1 to 200 MeV.** Nelson, R.O.; Laymon, C.M.; Wender, S.A. Los Alamos National Lab., NM (USA). [1990]. 16p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-901116–1: 11. international conference on the application of accelerators in research and industry, Denton, TX (USA), 5-8 Nov 1990). Order Number DE91000173. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Measurements of prompt gamma rays following neutron-induced reactions have recently been made at the spallation neutron source at the WNR target area of LAMPF using germanium detectors. These experiments provide extensive excitation function data for inelastic neutron scattering as well as for other reactions such as (n,α), (n,nα), (n,p), (n,np), (n,nnp) and (n,xn) for $1 \leq x \leq 11$. The continuous energy coverage available from 1 MeV to over 200 MeV is ideal for excitation function measurements and greatly extends the energy range for such data. The results of these measurements will provide a database for interpretation of gamma-ray spectra from the planned Mars Observer mission, aid in radiation transport calculations, allow verification of nuclear reaction models, and improve the evaluated neutron reaction data base.

52173 (INS–834) **Nuclear Landau-Zener phenomena and the fusion cross sections in the system $^{13}C + ^{16}O \rightarrow ^{12}C +$**

^{17}O. Imanishi, B.; Oertzen, W. von. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jul 1990. 11p. Order Number DE91713084. Source: NTIS (US Sales Only), PC A03/MF A01.

Reaction mechanism of the system $^{13}C+^{16}O$-$^{12}C+^{17}O$ is investigated with the use of the nucleon molecular-orbital model in the framework of the orthogonalized coupled-reaction-channel (OCRC) theory. The adiabatic potentials obtained are quite different from the diagonal potentials of the original OCRC basis. The Landau-Zener radial coupling explains the backward enhancement of measured differential cross sections of the transfer reaction $^{13}C(^{16}O, ^{17}O)^{12}C$. In the OCRC calculation the fusion cross sections of the channel $^{13}C+^{16}O$ is enhanced at low bombarding energies, in agreement with the experimental data. (author).

52174 (LUNFD6-NFFR-1009-1-142-1990) **The (γ, p) reaction in light nuclei at intermediate energies.** Nilsson, Dahn. Lund Univ. (Sweden). Dept. of Nuclear Physics. May 1990. 27p. Order Number DE91603164. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The (γ, p) reaction has been studied in the nuclei ^{6}Li, ^{9}Be, ^{12}C, ^{16}O, ^{27}Al and ^{40}Ca, with photon energies around 61 and 77 MeV. The photon tagging technique was used to achieve quasi-monochromatic photons. The protons were detected with a high energy resolution Si-Ge detector telescope, allowing for separation and identification of several low lying excited states in the daughter nuclei. With the same experimental setup also the (γ, d) reaction in ^{6}Li was studied. Data are compared with results from analogue reactions such as (e, e'p) and (π, NN). The results are mainly discussed in terms of photon absorption on single nucleons versus absorption on correlated nucleons. Experimental evidence indicates that photon adsorption on T=1 neutron-proton pairs is possible process, in contrast to the usual assumption in quasideuteron models that only adsorption on T=0 n-p pairs need to be considered. The (γ, p) and (γ, d) data on ^{27}Al and ^{40}Ca are also compared to results from pre-equilibrium calculations, where it is shown that the initial doorway configuration is a 2p-1h configuration.

52175 Isovector effective interactions from $^{14}C(p,n)^{14}N$ studies between 500 and 800 MeV. Sugarbaker, E. (Department of Physics, The Ohio State University, Columbus, OH (USA)); Marchlenski, D.; Taddeucci, T.N.; Rybarcyk, L.J.; McClelland, J.B.; Carey, T.A.; Byrd, R.C.; Goodman, C.D.; Huang, W.; Rapaport, J.; Mercer, D.; Prout, D. *Physical Review Letters (USA)*, 65(5): 551-554 (30 Jul 1990).

Cross sections at 0° for the pure Fermi (0^+, 2.31, MeV) and Gamow-Teller (1^+, 3.95 MeV) states in the $^{14}C(p,n)^{14}N$ reaction have been measured at E_p=494, 644, and 795 MeV using the LAMPF neutron time-of-flight facility with a new 617-m neutron flight path. The measured cross sections per unit transition strength, $\hat{\sigma}$, provide a measure of the isovector spin-flip and non-spin-flip central components of the effective nucleon-nucleon interaction. Cross sections and the ratio $R^2=\hat{\sigma}_{GT}/\hat{\sigma}_F$ are compared to lower-energy measurements and to calculations using a free *NN t* matrix.

52176 Particle-γ correlation determination of static quadrupole moments. Gross, E.E. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831-6368 (USA)); Hensley, D.C.; Beene, J.R. *Physical Review, C (Nuclear Physics) (USA)*, 42(2): R471-R474 (Aug 1990). DOE Contract AC05-84OR21400.

A complete particle-γ-ray angular correlation has been measured for the decay of the first 2^+ state of ^{24}Mg excited by ^{24}Mg(200 MeV)+^{208}Pb. The particle-γ-ray correlation, expressed as alignment tensors, proves to be particularly sensitive to the static quadrupole moment of the 2_1^+ state. The derived value of the 2_1^+ static quadrupole moment is Q_2=(−29±3) efm^2 which is (1.56±0.16) times larger than the rotational value.

52177 (CONF-9006281-1-Vugraphs) **Two-proton correlations from the ^{58}Ni + ^{58}Ni reaction at $E_{inc} \simeq$ 876.5 MeV.** Korolija, M. (Institut Rudjer Boskovic, Zagreb (Yugoslavia)); Shapira, D.; Del Campo, J.G.; Kim, H.J.; Teh, K.; Shea, J.Y. Oak Ridge National Lab., TN (USA). [1990]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Particle correlations and interferometry in nuclear collisions; Nantes (France); 28-30 Jun 1990. Order Number DE91000716. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The enhancement in the p-p correlation function from the ^{58}Ni + ^{58}Ni reaction at E_{inc} = 876.5 MeV is interpreted as a result of the interaction of the emitted protons in the final state. The p-p correlation function has been found to decrease very rapidly with the increase of the relative angle between the fragment and the two-proton c.m. velocities. This causes the extracted p-p correlation function to be dependent on the kinematics of the measurements. The deduced average particle emission times are in the range of 5 − 6 × 10^{-22} s.

52178 (ORNL/TM-11671) **Cross sections for production of 70 discrete-energy gamma rays created by neutron interactions with ^{56}Fe for E_n to 40 MeV: Tabulated data.** Dickens, J.K.; Todd, J.H.; Larson, D.C. Oak Ridge National Lab., TN (USA). Sep 1990. 30p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE91000871. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Inelastic and nonelastic neutron interactions with ^{56}Fe have been studied for incident neutron energies between 0.8 and 41 MeV. An iron sample isotopically enriched in the mass 56 isotope was used. Gamma rays representing 70 transitions among levels in residual nuclei were identified, and production cross sections were deduced. The reactions studied were $^{56}Fe(n,n')^{56}Fe$, $^{56}Fe(n,p)^{56}Mn$, $^{56}Fe(n,2n)^{55}Fe$, $^{56}Fe(n,d + n,np)^{55}Mn$, $^{56}Fe(n,t + n,nd + n,2np)^{54}Mn$, $^{56}Fe(n,\alpha)^{53}Cr$, $^{56}Fe(n,n\alpha)^{52}Cr$, and $^{56}Fe(n,3n)^{54}Fe$. Values obtained for production cross sections as functions of incident neutron energy are presented in tabular form. 38 refs., 7 figs., 12 tabs.

52179 Reinvestigation of ^{56}Ni decay. Sur, B. (Nuclear Science Division, Lawrence Berkeley Laboratory, 1 Cyclotron Road, Berkeley, California 94720 (USA)); Norman, E.B.; Lesko, K.T.; Browne, E.; Larimer, R. *Physical Review, C (Nuclear Physics) (USA)*, 42(2): 573-580 (Aug 1990). DOE Contract AC03-76SF00098.

In a series of experiments, we have reinvestigated the decay of the doubly magic nucleus ^{56}Ni, which is believed to be copiously produced in supernovae. We have confirmed its previously known decay scheme and half-life, and have searched for several rare decay modes. We establish an upper limit of 5.8×10^{-7} for the branching ratio of the second forbidden unique β^+ decay to the 158-keV level in ^{56}Co, leading to a lower limit of 2.9×10^4 yr for the half-life of fully ionized ^{56}Ni nuclei in cosmic rays. We also establish an upper limit of 5.0×10^{-3} for the branching ratio of the isospin forbidden Fermi electron capture transition to the 1451-keV level in ^{56}Co, which in turn leads to an upper limit of 124 keV for the isospin mixing Coulomb matrix element of the ^{56}Ni ground state.

52180 Proton mean field in ^{40}Ca between −60 MeV and +200 MeV deduced from a dispersive optical-model analysis. Tornow, W. (Department of Physics, Duke University, Durham, North Carolina 27706 (USA)); Chen, Z.P.; Delaroche, J.P. *Physical Review, C (Nuclear Physics) (USA)*, 42(2): 693-706 (Aug 1990). DOE Contract AC05-76ER01067.

The p-^{40}Ca mean field is derived from an optical-model (OM) analysis that explicitly incorporates the dispersion relation connecting the real and imaginary parts of the mean field. This analysis is based on differential cross-section, analyzing power, and reaction cross-section data available in the energy range between 20 and 180 MeV. The extrapolation of the OM potential from positive to negative energies provides the shell-model potential. This extrapolation is guided by known single-particle energies. The deeply bound 1p and 1s orbits clearly indicate the need for a linear rather than an exponential energy dependence of the Hartree-Fock potential at large negative energies. The analysis also provides

root-mean-square radii, occupation probabilities, spectral functions, and absolute spectroscopic factors for proton single-particle orbits in ^{40}Ca. Our calculated 15% depletion of the hole states in ^{40}Ca is lower than that suggested for ^{208}Pb from theoretical and experimental studies. We also find that a substantial amount of single-particle strength in ^{40}Ca is located at rather high excitation energy.

Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

Detailed information has recently become available on the reaction behaviour in very heavy nuclear systems close to the Coulomb barrier. Starting from an experimental study of the distribution of the reaction strength above and below the barrier, the dominant reaction channels of quasi-elastic and strongly-damped processes are examined. With decreasing incident energy, the sub-barrier collisions are increasingly dominated by quasi-elastic processes. From the division of internal excitation energy, new information is obtained on the nature of the dissipative processes. 15 refs., 4 figs. (author).

Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The possibility of observing spin-mixing of the two low-lying levels in ^{104}In is studied. 8 refs., 2 figs. (M.F.W.).

52189 (KFK–4725) **Emission of light and intermediate mass fragments (IMF) in reactions of 156 MeV ^{6}Li-ions with ^{nat}Ag.** Wentz, J. Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Inst. fuer Kernphysik. May 1990. 79p. (In German). Order Number DE91706309. Source: NTIS (US Sales Only), PC A05/MF A01.

Double differential cross sections $d^2\sigma/(d\Omega x dE)$ for production of light charged particles ($Z \leq 2$) are measured in the reaction 156 MeV ^{6}Li + ^{nat}Ag at laboratory angles between 13.5deg and 25deg. Typical bell-shaped distributions around beam-velocity are obtained as a signature of direct fast processes. By using different theoretical assumptions (Serber, Glauber and DWBA) angle integrated (total) cross sections are obtained for measured light ejectiles. Together with existing data on intermediate mass fragments (IMF) emission in the above reaction, the data on light ejectiles are used in a sum-rule model analysis. The extented sum-rule model is studied in detail and a new normalization procedure is proposed which restores the basic ideas of the original sum-rule model (convergency in l-space and l-windows for different ejectiles). Accordingly, the model gives a good description of the experimental data on a wide range of ejectile charge numbers. (orig.).

52190 Evidence for the contribution of $0f_{5/2},1p_{3/2}$ proton excitations in the low-lying states in ^{92,94}Zr. Mach, H. (The Studsvik Neutron Research Laboratory, S-61182 Nykoeping (Sweden)); Warburton, E.K.; Krips, W.; Gill, R.L.; Moszynski, M. *Physical Review, C (Nuclear Physics) (USA)*, 42(2): 568-572 (Aug 1990). DOE Contract AC02-76CH00016.

Lifetimes of $T_{1/2}$=88(3) and 291(11) ps were measured for the 0_2^+ states and $T_{1/2}$=102(3) and 500(13) ps for the 4_1^+ states in ^{92,94}Zr, respectively, using a recently developed β-γ-γ fast timing method. The observed $B(E2)$ values and the recently measured g factors for the 2_1^+ states in ^{92,94}Zr deviate strongly from properties of a pure $\nu 1d_{5/2}$ multiplet and even from the $\pi(1p_{1/2},0g_{9/2})\nu(1d_{5/2},2s_{1/2})$ shell-model results of Gloeckner. The experimental results are reproduced, however, by spherical shell model calculations with a model space of $\pi(0f_{5/2},1p_{3/2},1p_{1/2},0g_{9/2})\nu$ $(1d_{5/2},2s_{1/2},1d_{3/2},0g_{7/2})$ and provide compelling evidence for important contributions of $\pi f_{5/2},p_{3/2}$ orbits to the low-energy structure of these nuclei.

52191 Energy dependence of cross section for charge pickup of relativistic heavy ions. Guiru, J. (Physics Department, University of California, Berkeley, California 94720 (USA)); Williams, W.T.; Price, P.B. *Physical Review, C (Nuclear Physics) (USA)*, 42(2): 769-770 (Aug 1990).

We have measured the cross sections for charge pickup (ΔZ=+1) reactions of ^{139}La nuclei at three energies in the interval 390–560 MeV/nucleon in a stack of VG-13 glass detectors ($\langle A \rangle$=26). Our results support evidence by Binnes *et al.* that the cross sections for charge pickup by heavy nuclei increase as the energy decreases below ~600 MeV/nucleon.

52192 (INP–1414/PS, pp. 15-30) **Superdeformation - some recent Liverpool experiments.** Forsyth, P.D. (Liverpool Univ. (UK). Oliver Lodge Lab.). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

Studies of superdeformed nuclear states in the mass-150 region carried out by the Liverpool group at the Nuclear Structure Facility at Daresbury are described. The measurements were made using the multi-detector TESSA γ-ray spectrometers. The earlier results on the nucleus ^{152}Dy are summarised and recent measurements in both ^{152}Dy and ^{150}Gd are discussed. 15 refs., 10 figs. (author).

52193 (INP–1414/PS, pp. 115-131) **Structure of transitional Dy nuclei along and above the yrast line.** Daly, P.J. (Purdue Univ., Lafayette, IN (USA)); Quader, M.A.; Piiparinen, M. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

States in ^{154}Dy have been located up to I^{π} - 48^{+} and their lifetimes measured. Marked structural changes occur along the yrast line with a transition from prolate to oblate shape, followed by an unexpected return to moderate collectivity at the highest spins. The quasicontinuum spectrum in the sequence of isotopes ^{152}Dy, ^{154}Dy and ^{156}Dy has also been studied. A pronounced E2 component is displayed in all three nuclei, but only ^{154}Dy shows a splitting of the E2 bump into two distinct parts, both of fast collective nature. The E2 statistical components could be reproduced in simple γ cascade calculations. 14 refs., 6 figs., 2 tabs. (author).

52194 (INP–1414/PS, pp. 263-267) **A search for γ-rays depopulating the ^{152}Dy SD-band.** Styczen, J.; Gueven, H.; Urban, W.; Hebbinghaus, H.; Gast, W.; Menegazzo, R.; Kleinheinz, P. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The ^{152}Dy nucleus was studied through the (α, 4n) reaction, using the 6-detector anti-Compton OSIRIS system. A number of earlier unplaced ^{152}Dy γ-rays was noticed. Selected pertinent coincidence spectra are shown. 5 refs., 2 figs., 1 tab. (author).

52195 (LAFI–149) **Study of ^{187}W excited states from the (n,γ) reaction.** Simonova, L.I.; Bejtin'sh, M.R.; Rezvaya, G.L.; Prokof'ev, P.T. AN Latvijskoj SSR, Riga (USSR). Inst. Fiziki. 1989. 29p. Order Number DE91603198. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

γ-ray spectra of ^{187}W from the (n,γ) reaction are studied in the 100-5500 keV energy range. In the energy interval of 1.5-2.5 MeV the γ-transition have been observed for the first time. The level scheme of ^{187}W with 93 levels has been deduced up to the 3.5 MeV excitation energy. The levels are determined using the energy combination principle, the intensity balance of the populated and de-excited γ-transitions and γ-γ coincidences. Some of the intermediate levels determined by the coincidence method are suggested to be doublets. 3 refs.; 3 tabs.

52196 Effects of nuclear deformation on ^{151,153}Eu(p,n)^{151,153}Gd reactions. Lanier, R.G. (Nuclear Chemistry Division, Lawrence Livermore National Laboratory, Livermore, California 94550 (USA)); West, H.I. Jr.; Mustafa, M.G.; Frehaut, J.; Adam, A.; Philis, C.A. *Physical Review, C (Nuclear Physics) (USA)*, 42(2): R479-R482 (Aug 1990). DOE Contract W-7405-ENG-48.

Total cross sections for the ^{151,153}Eu(p,n)^{151,153}Gd reactions have been measured between 5 and 12 MeV. We observe a significant (≤35%) enhancement of the cross sections for ^{153}Eu relative to ^{151}Eu and find that the enhancement below ~10 MeV is due largely to the shape difference between ^{151}Eu(β_2=0.13) and ^{153}Eu(β_2=0.28).

(Germany, F.R.)). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186– : 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

Results of measurements of nuclear structure of ^{208}Pb, ^{210}Po and ^{211}Bi from triton induced reactions with a ^{209}Bi target are presented. 10 refs., 17 figs., 3 tabs. (M.F.W.).

52198 (INP–1414/PS, pp. 173-177) **Coulomb excitation of ^{226}Ra with ^{208}Pb.** Wollersheim, H.J. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.)); Emling, H.; Grein, H. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The electromagnetic properties of ^{226}Ra have been investigated by multiple Coulomb excitation. Level energies and reduced transition probabilities of high-spin states have been determined. The results are discussed in terms of a stable octupole deformation. 12 refs., 3 figs., 1 tab. (author).

52199 (INP–1414/PS, pp. 281-283) **Search for the 33/2$^+$ state of the $\nu i_{13/2}^{-3}$ configuration in ^{199,201,203}Pb.** Fant, B. (Helsinki Univ. (Finland). Dept. of Physics); Weckstroem, T.; Rosengard, U.; Carle, P.; Kaellberg, A.; Norlin, L.O.; Rensfelt, K.G.; Jain, H.C. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The main purpose of this work is to search for the $\nu(i_{13/2}^{-3})_{33/2^+}$ state in ^{199,201,203}Pb. Results of the half-life and g-factor measurements are given. (M.F.W.).

52200 **Coulomb versus nuclear breakup in ^{11}Li fragmentation.** Bertsch, G. (Cyclotron Laboratory, Michigan State University, East Lansing, Michigan 48824 (USA)); Esbensen, H.; Sustich, A. *Physical Review, C (Nuclear Physics) (USA),* 42(2): 758-761 (Aug 1990). DOE Contract W-31109-ENG-38.

The cross section for two-neutron removal from a beam of relativistic ^{11}Li is calculated in an eikonal approximation. We find a larger nuclear cross section in reactions with heavy nuclei than estimated by Kobayashi *et al.* This lowers the inferred Coulomb cross section for reactions on ^{208}Pb from 890 to a range of 560–740 mb, depending on the assumed single-particle binding energy of the valence neutron.

52201 (INP–1414/PS, pp. 179-184) **Bimodal fission.** Sobiczewski, A. (Institute of Nuclear Research, Warsaw (Poland)). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The nuclei around heavy fermion isotopes show some peculiarities in their spontaneous-fission properties such as the mass and the total kinetic energy distributions of the fission fragments, the multiplicity distribution of neutrons emitted from the fragments and the spontaneous-fission half-lives T_{sf}. A short review of these properties with the emphasis to bimodal fission which consists in the simultaneous appearance of two different modes of fission for a given nucleus: one mode corresponding to a low (about 200 MeV) and the other to a high (around 240 MeV) kinetic energy of the fission fragments, is given. 9 refs., 10 figs. (M.F.W.).

52202 (INP–1414/PS, pp. 233-260) **Optical spectroscopy of fission isomers - an experimental challenge.** Backe, H. (Mainz Univ. (Germany, F.R.). Inst. fuer Physik); Achenbach, W.; Arndt, Th. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

Optical spectroscopy on americium fission isomers is discussed and it is explained why the fission - RADOP (radiation detected optical pumping) method is chosen. The main components of the experimental set-up are described: the ^{242}Pu target, the fission isomer accelerator and the optical cell. The experiments done to determine the neutralization rates of americium ions in argon and explain what happens if alkali vapour is added are also described. The results of the searches for a fission fragment anisotropy signal are presented. 36 refs., 15 figs. (author).

52203 (LA-UR–90-3193) **Parity and time-reversal symmetry nonconservation in neutron-nucleus interactions.** Bowman, J.D. (Los Alamos National Lab., NM (USA)); Bowman, C.D.; Knudson, J.; Penttilae, S.; Seestrom, S.J.; Szymanski, J.J.; Yuan, V.W.; Bush, J.E.; Frankle, C.M.; Gould, C.R.; Haase, D.G.; Mitchell, G.E; Delheij, P.P.J.; Postma, H.; Roberson, N.R. Los Alamos National Lab., NM (USA). [1990]. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36 ;AC05-76ER01067 ;FG05-88ER40441. (CONF-9005233–5: 2. international conference on medium- and high-energy physics, Taipei (Taiwan), 8-18 May 1990). Order Number DE91000425. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Parity non-conversation was studied for seventeen states in the compound nucleus ^{239}U by measuring the helicity dependence of the p-wave resonance cross section for epithermal neutrons scattered from ^{238}U. The root-mean-squared parity-violating matrix element for the mixing of p-wave and s-wave states was determined to be $M = 0.58_{-0.25}^{+0.50}$ meV. This corresponds to a parity-violating spreading width of $\Gamma^{PV} = 1.0 \times 10^{-7}$ eV. This gives a value of 4×10^{-7} for α_p, the ratio of strengths of the P-odd and P-even effective nucleon-nucleon interactions in ^{239}U. The implications of these results for studies of Time Reversal Symmetry in the compound nucleus is discussed.

52204 (BNL–45195) **Mesonic effects in nuclei near ^{208}Pb deduced from β decay.** Warburton, E.K. Brookhaven National Lab., Upton, NY (USA). [1990]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-901057–2: 7. international symposium on capture gamma-ray spectroscopy and related topics, Pacific Grove, CA (USA), 14-19 Oct 1990). Order Number DE91000904. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The mesonic enhancement of the time-like component of the weak axial current in nuclear matter is very large and is best observed via its effect on the decay rate of $\Delta J = 0$ $(\pi_i\pi_f = -)$ β decay. Studies in the A = 16, 40, and 90 regions yield enhancements of 40–60% over the impulse approximation. The lead region is a rich source of information on these first-forbidden decays. This study is the first to extract information on mesonic enhancement from these decays. ^{206}Hg $\rightarrow$ ^{206}Tl $\rightarrow$ ^{206}Pb is chosen to exemplify the approach which has been applied to 10 or so first-forbidden decays in A = 205–214 nuclei. The nuclear wave functions are

evaluated via large-basis shell-model calculations. The results indicate a much larger enhancement than expected and thus the possibility of some non-nucleonic effect in addition to the mesonic enhancement considered to date.

52205 (DOE/ER/40150–129) **Schematic model of nuclear spin excitations.** Boucher, P.M. Southeastern Universities Research Association, Newport News, VA (USA). Continuous Electron Beam Accelerator Facility. [1990]. 9p. Sponsored by Natural Sciences and Engineering Research Council of Canada; U.S. DOE Energy Research. DOE Contract AC05-84ER40150. (CEBAF-PR–90-005). Order Number DE91000432. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A simple model to estimate the strength of spin and nonspin collective states is presented. The model was inspired by early schematic models based on energy-weighted sum rules and is a useful tool for interpreting experimental data without the complexities of realistic microscopic calculations. The strength of collective states is calculated by assuming that a single collective state completely exhausts the energy-weighted sum rule. 19 refs.

52206 (GSI–90-39(prepr.)) **Strangeness production in ultra-relativistic heavy-ion collisions: Flavour kinetics. Pt. 2.** Barz, H.W. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)); Schulz, H.; Friman, B.L.; Knoll, J. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Jul 1990. 23p. Order Number DE91706313. Source: NTIS (US Sales Only), PC A03/MF A01.

A recently presented model for the non-equilibrium expansion and hadronization of and the strangeness production in a quark-gluon plasma is developed further. The model includes all members of the lowest flavour SU(3) multiplets, the effect of particle evaporation from the surface of the system and a hydrodynamic treatment of the volume expansion. The evaporation and the decay of resonances are found to be equally important for the production of pions and kaons, and to give about 60% of the total yield. If a quark-gluon plasma is formed, the relative strangeness yield is strongly enhanced compared to pp collisions. The predictions of the model are also compared to recent data for nucleus-nucleus collisions. (orig.).

52207 (GSI–90-40(prepr.)) **Intermittency in nuclear multifragmentation.** Ploszajczak, M. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.)); Tucholski, A. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany, F.R.). Jul 1990. 50p. Order Number DE91706315. Source: NTIS (US Sales Only), PC A03/MF A01.

Fluctuations of the fragment size distribution in a percolation model and in nuclear multifragmentation following the breakup of high energy nuclei in the nuclear emulsion are studied using the method of scaled factorial moments. An intermittent patern of fluctuations is found in the data as well as in the percolation lattice calculation. This is a consequence of both a self-similarity in the fragment size distribution and a random character for the scaling law. These fluctuations are in general well-described by percolation model. The multifractal dimensions are calculated and their relevance to the study of possible critical behaviour is pointed out. (orig.).

52208 (INP–1414/PS) **Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.** Broda, R.; Stachura, Z. (eds.). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. 338p. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The proceedings contain 16 lectures and 16 papers presented during seminars. Main topics of lectures and papers are nuclear structure, nuclear deformation excited and high spin states and heavy ion reactions. (M.F.W.).

52209 (INP–1414/PS, pp. 1-14) **Damping of rotational motion in nuclei.** Stephens, F.S. (Lawrence Berkeley Lab., CA (USA)). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The lecture consists of three main parts. First, it is considered what rotational damping is and why it is interesting. In the second part the evidence for such damping is discussed and finally motional narrowing is mentioned (one aspect of the damping not understandable at all). 11 refs., 13 figs. (author).

52210 (INP–1414/PS, pp. 277-279) **Polarized electric dipole moment and octupole deformation of the nucleus.** Denisov, V.Yu. (AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Yadernykh Issledovanij). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The polarized electric dipole moment (PEDM) of the nucleus is calculated and the relationship between PEDM and octupole deformation is studied. 9 refs. (M.F.W.).

52211 (INP–1414/PS, pp. 289-292) **Subshell effects in the A≈100 region.** Mach, H. (Brookhaven National Lab., Upton, NY (USA)). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

Subshell effects in the A≈100 nuclei are studied. (M.F.W.).

52212 (INP–1414/PS, pp. 273-275) **Quadrupole and hexadecapole deformations of ^{222}Ra in "cranking" and GCM models.** Robledo, L.M. (Universidad Autonoma de Madrid (Spain). Dept. de Fisica Teorica); Egido, J.L.; Nerlo-Pomorska, B.; Pomorski, K. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The results of the theoretical calculations of multipole deformations for ^{222}Ra in different approaches: mean field, cranking and GCM are presented and compared with the available experimental data. The collective hamiltonian is found within framework of the cranking and GCM method. (M.F.W.).

52213 (INP–1414/PS, pp. 321-325) **The role of n-p interaction in developing the nuclear deformation.** Dobaczewski, J. (Warsaw Univ. (Poland). Inst. Fizyki Teoretycznej); Werner, T.; Nazarewicz, W.; Skalski, J. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The analysis of n-p interaction effects on the nuclear deformation within the self-consistent Hartree-Fock method with realistic effective two-body interaction is presented. 7 refs., 7 figs. (author).

52214 (INP–1414/PS, pp. 327-329) **The pairing interactions strength for the case of particle number projection.** Pilat, S. (Uniwersytet Marii Curie-Sklodowskiej, Lublin (Poland). Inst. Fizyki); Staszczak, A. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane,*

Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure. 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The pairing interactions strength is determined in the case of the number projection. Calculations are made for the rare-earth region. 6 refs., 2 figs. (M.F.W.).

52215 (INP–1414/PS, pp. 331-335) **Quasiparticle-core coupling calculations for odd N=83 nuclei.** Rashkova, N. (Sofia Univ. (Bulgaria)); Karloukovski, V.; Matev, M.; Michailova, M.M. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The purpose of the present paper is to analise the positive parity states of ^{137}Xe, ^{139}Ba, ^{141}Ce, ^{143}Nd and ^{145}Sm nuclei in the framework of the model in which it is supposed that the states of the odd A nucleus are superposition of the states R,A±1 of both (A-1) and (A+1) even-even nuclei. 11 refs., 2 figs. (author).

Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The idea and some results of the classical calculations of the subbarrier heavy ion fusion reactions are presented. 5 refs., 4 figs. (M.F.W.).

52217 (INP–1414/PS, pp. 309-311) **Fission barrier in local approximation.** Strutinsky, V.M. (AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Yadernykh Issledovanij); Tsekmistrenko, I.Yu. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1988. (CONF-8804186–: 23. Zakopane school on physics, Zakopane (Poland), 16-30 Apr 1988). In *Proceedings of 23. Zakopane school on physics, Zakopane, Poland, 16-30 April 1988. Part 1: Part 1. Selected topics in nuclear structure.* 338p. Order Number DE91603094. Source: NTIS (US Sales Only), PC A15/MF A01; OSTI; INIS.

The purpose of this paper is to calculate the dependence of nuclear deformation energy on the distance between centers of fission fragments. (author).

52218 (INS–835) **Quantum chaoticity and fractional parentage plot based on the microscopic theory of nuclear collective dynamics: Violation of separability condition to specify optimum collective subspace.** Tsukuma, H.; Sakata, F.; Marumori, T.; Yamamoto, Y. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Aug 1990. 85p. Order Number DE91713085. Source: NTIS (US Sales Only), PC A05/MF A01.

Being based on the dynamical theory of nuclear collective dynamics, in the previous paper, we have proposed a general method for evaluating the stochasticity of individual eigenfunctions. It has been demonstrated that an onset of quantum chaos is induced by a dissolution of quantum numbers, which is accompanied by the violation of separability condition for an optimum collective subspace. On the other hand, there exists a well established method for analyzing the stochasticity of an ensemble of eigenstates, i.e. the level statistics based on the random matrix theory which is based on some probabilistic assumptions. It is the objective of the present paper to build a bridge between the two different approaches to the quantum chaos, with and without probabilistic assumptions. (author).

52219 (KFTI–88-40) **Inclusive deuteron electrodisintegration outside the quasielastic peak and dibaryon resonances.** Rekalo, M.P.; Gakh, G.I.; Rekalo, A.P. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 23p. (In Russian). Order Number DE91603120. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Effect of dibaryon resonances (DR) on inclusive electron spectra in splitting of nonpolarized deuterons d(e,e')np is considered. Energy dependence of separate DR contributions is described by Breit-Wigner formula, masses and resonance widths with τ^P=0$^+$,1$^-$ and 2$^+$ are taken from results of multipole analysis in γ+d → n+p. Spin structure of resonance contributions describes absorption of virtual photons of low possible multipolarity, namely M1 under DR excitation with τ^P=0$^+$ and 2$^+$ and E1 - under DR excitation with τ^P=1$^-$; (n+p) system is formed at this singlet state. Resonance constants are found using χ^2-fitting of the model predictions based on account of DR and relativistic impulse approximation to experimental data relatively electron spectra in d(e,e')np in the vicinity of quasielastic peak. 102 refs.; 8 figs.

52220 (KFTI–88-42) **Low-energy pion interaction with lightest nuclei.** Gur'ev, V.N. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 16p. (In Russian). Order Number DE91603121. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The present state of low-energy pion interaction with ^{2}H, ^{3}He, ^{4}He nuclei is considered. Calculation of differential cross sections $(\alpha\sigma/d\Omega)_{\pi\pm}$ of elastic scattering of positive and negative pions on ^{4}He nucleus with the energy of T_π=30 MeV (in lab.syst.) and variation of inelasticity parameters with angular moment l=0 and 1 are presented. Highcriticality of estimations of total cross section for (π, ^{4}He) reaction extracted from elastic scattering analysis to $(d\sigma/d\Omega)_{\pi\pm}$ behaviour in minimum range is detected. Some actual problems of experimental and theoretial studies of low-energy pion interaction with the lightest nuclei are discussed. 25 refs.; 10 figs.; 1 tab.

52221 (KFTI–88-43) **Stochastic dynamics of quadrupole oscillations for krypton isotopes.** Bolotin, Yu.L.; Gonchar, V.Yu.; Tarasov, V.N.; Chekanov, N.A. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 12p. (In Russian). Order Number DE91603103. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Structure of classical phase space of Hamiltonian of quadrupole surface oscillations for krypton isotopes is studied. For each isotope a set of critical energies of transition from regular motion to chaotic one is determined. In the vicinity of local minima additional (excluding energy) motion integrals are constructed. 20 refs.; 6 figs.

52222 (LA-UR–90-3335) **General quadrupole shapes in the Interacting Boson Model.** Leviatan, A. Los Alamos National Lab., NM (USA). [1990]. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-9009135–2: International conference on high spin physics and gamma-soft nuclei, Pittsburgh, PA (USA), 17-21 Sep 1990). Order Number DE91000178. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Characteristic attributes of nuclear quadrupole shapes are investigated within the algebraic framework of the Interacting Boson Model. For each shape the Hamiltonian is resolved into intrinsic and collective parts, normal modes are identified and intrinsic states are constructed and used to estimate transition matrix elements. Special emphasis is paid to new features (e.g. rigid triaxiality and coexisting deformed shapes) that emerge in the presence of the three-body interactions. 27 refs.

52223 (LBL–29482) **Order, chaos and nuclear dynamics: An introduction.** Swiatecki, W.J. Lawrence Berkeley Lab., CA (USA). Aug 1990. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-900857–1: Mikolajki summer school on nuclear physics: nuclear and atomic physics with accelerators of the nineties, Mikolajki (Poland), 26 Aug - 5 sep 1990). Order Number DE91000232. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This is an introductory lecture illustrating by simple examples the anticipated effect on collective nuclear dynamics of a transition from order to chaos in the motions of nucleons inside an idealized nucleus. The destruction of order is paralleled by a transition from a rubber-like to a honey-like behaviour of the independent-particle nuclear model. 10 refs., 6 figs.

52224 (SLAC-PUB-5343) **Anti-proton annihilation in nuclei as a probe of QCD.** Brodsky, S.J. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Sep 1990. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-900766-3: 1. biennial conference on low energy antiproton physics, Stockholm (Sweden), 2-6 Jul 1990). Order Number DE91000462. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Anti-proton annihilation in a nuclear target can test many novel aspects of quantum chromodynamics. In this talk I discuss a number of interesting features of such processes, including the formation of nuclear-bound quarkonium, tests of color transparency in hard, quasi-elastic nuclear reactions, higher-twist, coherent, and formation zone effects in hard inclusive nuclear reactions, reduced amplitude predictions for exclusive nuclear amplitudes, and color filter effects inclusive open and hidden charm production in nuclei. 43 refs., 6 figs., 2 tabs.

52225 (UCRL-JC-104986) **Needs for experiment and theory in intermediate energy reactions.** Blann, M. Lawrence Livermore National Lab., CA (USA). 5 Sep 1990. 37p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9010199-1: Advisory group meeting on intermediate energy nuclear data for applications, Vinna (Austria), 9-12 Oct 1990). Order Number DE91000254. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We summarize several reasons intermediate energy data are needed in both basic and applied science. The status of the data base at energies up to 2 GeV is cursorily reviewed. Experimental excitation functions, single and double differential cross sections are compared with predictions of the nuclear model code ALICE. The strengths and weakness of the code to reproduce data are summarized. Opinions are given as to areas where data are too few or totally lacking, yet are needed for the verification of models and theories. 25 refs.

52226 **Calculational capabilities for nuclear data.** Bozoian, M. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, NM (US)). pp. 27-38 of High energy and heavy ion beams in materials analysis. Tesmer, J.R.; Maggiore, C.J.; Nastasi, M.; Barbour, J.C.; Mayer, J.W. Materials Research Society, Pittsburgh, PA (USA) (1990). pp. 290 (CONF-8906186-: Materials Research Society high energy and heavy ion beams in materials analysis workshop, Albuquerque, NM (USA), 14-16 Jun 1989).

The Applied Nuclear Science Group of Los Alamos National Laboratory has provided theoretical expertise and nuclear data, particularly in the areas of neutron physics, fission and fusion, for many years. In this paper, the author outlines current efforts - low to intermediate energy nuclear models and calculations, resonance theory, activation analysis - that are pertinent and useful to materials scientists.

52227 **Finding nuclear data: The National Nuclear Data Center.** Pearlstein, S. (Brookhaven National Lab., Upton, NY (US)). pp. 189-196 of High energy and heavy ion beams in materials analysis. Tesmer, J.R.; Maggiore, C.J.; Nastasi, M.; Barbour, J.C.; Mayer, J.W. Materials Research Society, Pittsburgh, PA (USA) (1990). pp. 290 (CONF-8906186-: Materials Research Society high energy and heavy ion beams in materials analysis workshop, Albuquerque, NM (USA), 14-16 Jun 1989).

Nuclear reaction cross-sections and nuclear structure properties are useful for material analysis applications. The nuclear data requirements for material analysis overlap with the data requirements for other research fields, e.g. fission and fusion reactors, so that reference material may be used more widely than the original purpose in mind. The National Nuclear Data Center at Brookhaven National Laboratory, an outgrowth of data compilation and evaluation activities begun more than 40 years ago, specializes in indexing the bibliography, data compilation and data evaluation of nuclear reaction cross- sections and nuclear structure properties. Reference material that are available in many forms that include handbooks, data bases and on-line services are reviewed.

52229 (CONF-8804141-, pp. 153-162) **Calculated Bethe stopping powers for protons in metals.** Sabin, J.R. (Univ. of Florida, Gainesville (USA)); Oddershede, J. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The previous calculations of atomic stopping powers and shell corrections have shown that a necessary condition for the calculation of Bethe stopping over the whole range of nonrelativistic electron stopping is that the stopping be considered shellwise, and that the mean excitation energy be considered as composed of contributions from individual shells. Comparison of calculated atomic stopping with experimental stopping powers leads to the conclusion that phase dependence of the total mean excitation energy is not as important as variation in the valence orbital mean excitation energy. This arises from the fact that the target phase dependent differences in stopping are prevalent at low energies, where stopping by the valence electrons is predominant. Recently a methodology has become available enabling the authors to make solid state calculations which are consistent with their atomic calculations. They thus report here comparison calculations for the phase dependence of the Bethe stopping of several metals for protons in the energy range 50 keV $< E_p <$ 40 MeV. 46 refs., 4 figs.

52230 (JAERI-M-90-092) **Experimental results of angular neutron flux spectra leaking from slabs of fusion reactor candidate materials, (1).** Oyama, Yukio (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Maekawa, Hiroshi; Yamaguchi, Seiya. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1990. 128p. Order Number DE91712985. Source: NTIS (US Sales Only), PC A07/MF A01.

This report summarizes experimental data of angular neutron flux spectra measured on the slab assemblies of fusion reactor candidate materials using the neutron time-of-flight (TOF) method. These experiments have been performed for graphite (carbon), beryllium and lithium-oxide. The obtained data are very suitable for the benchmark tests to check the nuclear data and calculational code systems. For use of that purpose, the experimental conditions, definitions of key terms and results obtained are compiled in figures and numerical tables. (author).

52231 (JAERI-M-90-097) **Production of multi-group double differential form cross section library using JENDL-3 and benchmark test of fusion neutronics problems.** Nakagawa, Masayuki (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Mori, Takamasa; Kaneko, Kunio. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1990. 98p. (In Japanese). Order Number DE91713052. Source: NTIS (US Sales Only), PC A05/MF A01.

A 125 group double differential form cross section library has been produced from an evaluated nuclear data file JENDL-3. Benchmark problems on fusion neutronics were solved and the results were compared with measurements and calculated values by JENDL-3/PR1. The cross section set of twenty nuclides which are used in fusion neutronics analyses have been produced by the PROF-DD code system. Some multi-group activation cross sections have been also produced for reaction rate calculations. Four kinds of benchmark problems were solved in order to evaluate characteristics of JENDL-3. Those include the neutron leakage spectra from spherical piles measured in LLNL, the neutron multiplication experiments for beryllium sphere performed in Krchatov Laboratory, the JAERI-US calculational benchmark problems and the fusion blanket engineering experiment at the FNS. JENDL-3 gives similar tritium production rates in a blanket as JENDL-3/PR1. (author).

52232 (KURRI-TR-332) **Proceedings of 'workshop on physico-mathematical study useful for effective utilization of thermal neutrons in reactor'.** Shibuya, Iwao; Ueno, Yowri; Ueno, Sueo (eds.). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. May 1990. 86p. (In Japanese). (CONF-9001118-: Workshop on physico-mathematical study useful for effective utilization of thermal neutrons in reactor, Kumatori (Japan), 8-9 Jan 1990). Order Number DE91712932. Source: NTIS (US Sales Only), PC A05/MF A01.

During the 'Workshop on Physico-Mathematical Study useful for Effective Utilization of Thermal Neutrons in Reactor', which took place in the Research Reactor Institute, Kyoto University, 8-9 January, 1990, fourteen scientific papers were presented to thirty participants. All of the papers are collected in this monograph of proceedings. In the present stage of the physical research utilizing neutron beams, new ideas and diversed conception are radically required. Then, it seemed that the application of the theory at radiative transfer in geo- and astro-physics, and the quantum statistical analysis in canonical ensembles would be most appropriate. The subject of this workshop consists of an introduction of the new approach to and theoretical ideas for the field of neutron utilization as follows: (a) The diagnosis of cancer by X-rays, gamma rays, and neutron beams; (b) The analytical and numerical computation of the multiple scattering models of the visible and radiant rays in plane-parallel, cylindrical and spherical media; (c) The computational analysis of the tomographic and geotopographic images; (d) The diffuse reflection of solar rays by terrestrial atmosphere, allowing for the ecological, anisotropic and topographic effects; (e) The inverse problems of radiant and visible rays in slab, cylindrical and spherical media; (f) The numerical solution of integro-differential equation, the neuronetwork models and artificial intelligence. (J.P.N.).

52233 (LA-UR-90-3127) **The effect of surface roughness on the phase of neutrons specularly reflected at grazing incidence.** Hamilton, W.A.; Pynn, R. Los Alamos National Lab., NM (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-9008161-1: Workshop on methods of analysis and interpretation of neutron reflectivity data, Argonne, IL (USA), 23-25 Aug 1990). Order Number DE91000238. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The effect of surface roughness on the specular intensity of a reflected neutron beam can be calculated using the distorted wave Born approximation. For Gaussian roughness the result obtained is the familiar expression of Nevot and Croce. When the distribution of surface heights, z, is proportional to $\cosh^{-2}(z/2d)$, the calculated reflectance is $\sinh[\pi d(k_0-k_1)]/\sinh[\pi d(k_0+k_1)]$. Here k_0 and k_1 are the components of neutron wavevectors perpendicular to the interface, evaluated outside and inside the reflecting medium, and d is a measure of the amplitude of the roughness. This result for the reflectance differs by a phase factor from that obtained in an exact calculation for an interface with the corresponding graded refractive index. The phase difference between the two expressions is small, scaling as $\sim d^3$, and usually has little effect on measured reflectivities of multilayered structures. Ways in which the phase could be determined are discussed.

52234 (LUNFD6-NFRA-1024-1-63-1990) **Development and evaluation of attenuation and scatter correction techniques for SPECT using the Monte Carlo method.** Ljungberg, M. Lund Univ. (Sweden). Dept. of Radiation Physics. May 1990. 63p. (LUMEDW-MERI-1024-1-63-1990). Order Number DE91603090. Source: NTIS (US Sales Only), PC A04/MF A01; OSTI; INIS.

Quantitative scintigrafic images, obtained by NaI(Tl) scintillation cameras, are limited by photon attenuation and contribution from scattered photons. A Monte Carlo program was developed in order to evaluate these effects. Simple source-phantom geometries and more complex nonhomogeneous cases can be simulated. Comparisons with experimental data for both homogeneous and nonhomogeneous regions and with published results have shown good agreement. The usefulness for simulation of parameters in scintillation camera systems, stationary as well as in SPECT systems, has also been demonstrated. An attenuation correction method based on density maps and build-up functions has been developed. The maps were obtained from a transmission measurement using an external ^{57}Co flood source and the build-up was simulated by the Monte Carlo code. Two scatter correction methods, the dual-window method and the convolution-subtraction method, have been compared using the Monte Carlo method. The aim was to compare the estimated scatter with the true scatter in the photo-peak window. It was concluded that accurate depth-dependent scatter functions are essential for a proper scatter correction. A new scatter and attenuation correction method has been developed based on scatter line-spread functions (SLSF) obtained for different depths and lateral positions in the phantom. An emission image is used to determine the source location in order to estimate the scatter in the photo-peak window. Simulation studies of a clinically realistic source in different positions in cylindrical water phantoms were made for three photon energies. The SLSF-correction method was also evaluated by simulation studies for 1. a myocardial source, 2. uniform source in the lungs and 3. a tumour located in the lungs in a realistic, nonhomogeneous computer phantom. The results showed that quantitative images could be obtained in nonhomogeneous regions. (67 refs.).

In this report, a general review of the daily activities and managements of The Division of Radiation Control, Research Reactor Institute, Kyoto University, in 1988, is described, and it is published as 'The Radiation Control Report: No. 25'. As the special matters, two big troubles of the reactor (KUR) arose; one was a leakage of the secondly cooling water from the heat exchangers, and the other was leakage of heavy water containing tritium from the heavy water thermal column for the neutron irradiation facility. For the repairs of these troubles, staffs of the Division of Radiation Control made their great efforts including radioactivity measurements of the leaked waters and air bones, and also radiation dose of the workers for the repairs of these facilities. These activities continued for more than one year. At present time, the repairing works are proceeding favorably and will complete within a few month. From the academic year from April of 1989, the new rules for the handlings of the radiation and radioactive substances will be enforced. Accordingly, in this year, 1988, the staffs of The Division of Radiation Control are making great efforts for the pretreatments to such situation. (author).

Doses from natural radiation to the population in Nordic Countries are summarized and man made modifications of the natural radiation environment are discussed. An account is given of the radiological consequences of energy conservation by reduced ventilation. Risks from possible future releases of radioactivity from final repositories of spent nuclear fuel are compared to the risks from present natural radioactivity in the environment. The possibilities for comparison between chemical and radiological risks are discussed.

52237 (RERF-TR-19-89) **Organ doses to atomic bomb survivors from radiological examinations at the Radiation Effects Research Foundation.** Kato, Kazuo; Antoku, Shigetoshi; Sawada, Shozo; Russell, W.J. Radiation Effects Research Foundation, Hiroshima (Japan). Apr 1990. 14p. Order Number DE91712968. Source: NTIS (US Sales Only), PC A03/MF A01.

When estimating the risks of oncogenesis and cancer mortality as a result of atomic bomb radiation exposure, medical X-ray doses received by the A-bomb survivors must also be estimated

and considered. Using a phantom human, we estimated the X-ray doses received by A-bomb survivors during routine biennial medical examinations conducted at RERF as part of the long-term Adult Health Study (AHS), since these examinations may represent about 45 % of the survivors' total medical irradiations. Doses to the salivary glands, thyroid gland, lung, breast, stomach and colon were measured using thermoluminescent dosimeters. The results reported here will aid in estimating organ doses received by individual AHS participants. (author).

52238 **Radiation hazards of (α,n) reactions.** Basu, S.N. (Los Alamos National Lab., Los Alamos, NM (US)); Tesmer, J.; Nastasi, M. pp. 279-286 of High energy and heavy ion beams in materials analysis. Tesmer, J.R.; Maggiore, C.J.; Nastasi, M.; Barbour, J.C.; Mayer, J.W. Materials Research Society, Pittsburgh, PA (USA) (1990). pp. 290 (CONF-8906186–: Materials Research Society high energy and heavy ion beams in materials analysis workshop, Albuquerque, NM (USA), 14-16 Jun 1989).

This paper deals with the radiation hazards associated with the generation of neutrons during (α,n) reactions. The neutron radiation dosage associated with the irradiation of the lower atomic number elements and some compounds are tabulated for incident α particles having energies up to 10 MeV. The tables also list the number of hours of radiation per week required to exceed a tenth of the maximum allowable radiation exposure of 5 rem per year.

Arizona State Univ., Tempe, AZ (USA). Center for Solid State Electronics Research. 15 May 1990. 9p. Contract N00014-90-J-1247. (N–90-7). Source: NTIS, PC A02/MF A01.

Pub. in Physical Review B, Vol. 41, No. 14, 9899-9906(15 May 1990).

The transient expansion of the photogenerated electron-hole plasma in semiconductors is examined with the ensemble Monte Carlo technique. A high photoexcitation energy is used to study the nonequilibrium optical-phonon effects, with both their temporal and spatial dependences being included for the first time. Specific numerical calculations within the picosecond regime are given for InP. Our results demonstrate that the nonequilibrium phonons significantly enhance the expansion of the plasma during the first few picoseconds, and change the spatial-carrier-distribution profiles.

52240 (CONF-900936–9) **Dose rate effects on damage formation in ion-implanted gallium arsenide.** Haynes, T.E.; Holland, O.W. Oak Ridge National Lab., TN (USA). Sep 1990. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 7. international conference on ion beam modification of materials; Knoxville, TN (USA); 9-14 Sep 1990. Order Number DE91000394. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The residual damage in GaAs was measured by ion channeling following implantation of either 100 keV $^{30}Si^{+}$ at temperatures of 300K or 77K, or 360 keV $^{120}Sn^{+}$ at 300K. For room-temperature Si implants and fluences between 1 and 10 x 10^{14} Si/cm^2, the amount of damage created was strongly dependent upon the ion current density, which was varied between 0.05 and 12 μA/cm^2. Two different stages of damage growth were identified by an abrupt increase in the damage growth rate as a function of fluence, and the threshold fluence for the onset of the second stage was found to be dependent on the dose rate. The dose rate effect on damage was substantially weaker for $^{120}Sn^{+}$ implants and was negligible for Si implants at 77K. The damage was found to be most sensitive to the average current density, demonstrating that the defects which are the precursors to the residual dose-rate dependent damage have active lifetimes of at least 3 x 10^{-4} s. The dose rate effect and its variation with ion mass and temperature are discussed in the context of homogeneous nucleation and growth of damage during ion irradiation.

52241 (CONF-901116–8) **High-resolution heavy-ion-induced x-ray satellite emission study of implanted sulfur as a probe of co-implanted oxygen in an oxide substrate.** Rosseel, T.M. (Oak Ridge National Lab., TN (USA)); Young, J.P.; Vane, C.R.; Zuhr, R.A.; Peterson, R.S. Oak Ridge National Lab., TN (USA). [1990]. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 11. international conference on the application of accelerators in research and industry; Denton, TX (USA); 5-8 Nov 1990. Order Number DE91000622. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Using high-resolution measurements, the relative fluorescence yields of the sulfur $K_\alpha L^n$ x-ray satellite lines produced by 24 MeV Si^{9+} ion irradiation of a series of quartz glass targets co-implanted to equal doses and depths of sulfur and oxygen have been obtained and compared to the yields from a series of quartz glass targets implanted to the same depth with sulfur only. The data exhibit lower yields in the higher-order KL^n satellite lines for the co-implanted oxygen targets but similar dose dependent curves. These results are consistent with oxygen increasing the valence electron density of the local sulfur environment. It also suggests that, with an appropriate choice of a probe ion, HIXSE may be capable of detecting impurity ions in matrices that normally mask the impurity, e.g., oxygen in oxide substrates. 10 refs., 3 figs.

52242 (CONF-8804141–, pp. 1-11) **Energy loss of a charged particle moving near the surface of a superlattice.** Gumbs, G. (Institut fuer Festkoerperforschung der Kernforschungsanlage Julich (West Germany)). Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

In this paper, the surface response function $g(q_{\|},\omega)$ is calculated for an array of parallel two-dimensional electron gas layers ($q_{\|}$ is the wave vector parallel to the surface and ω is the frequency). Here, a point charge moves along a prescribed path above the surface. The external potential generated by this charged particle will give rise to an induced potential which outside the superlattice can be written as a sum of evanescent plane waves whose amplitude defines the linear response function g. It is implicitly assumed that the external potential is so weak that the medium couples linearly to it. Of course, the function $g(q_{\|},\omega)$ is related to the density-density response function. The energy transfer Δ E from the particle probe is obtained by integrating the Poynting vector over the surface and over time. A general expression for Δ E for an arbitrary particle trajectory is obtained in terms of the loss function Im $g(q_{\|},\omega)$ which is proportional to the power absorption in the medium due to the external electric potential. Explicit closed form results for g are presented for a multi-layered system. Numerical results for the energy loss have been obtained for a single layer. 17 refs., 2 figs.

52243 (CONF-8804141–, pp. 13-18) **Image states on insulators.** Arnau, A. (Universidad del Pais Vasco, Euskadi (Spain)); Echenique, P.M. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

Image states represent a very simple and fundamental class of surface states which might be very useful to study the two dimensional (2-D) electron gas. Intensive work has been done directed to understand the properties of such states in different surfaces. In materials with a small dielectric constant, like helium, the binding is weak (≈meV) and an unstability of the 2-D electron gas develops when the density is increased. In metals the binding is stronger (≈0.7eV), but a problem arises because the energy halfwidth of these states due to decaying into bulk states (interband) is too high and comparable to the one associated with the loss of parallel momentum within the band (intraband). In insulators, such as diamond or LiF, relatively strong binding appears and escape outside

the band into bulk states is prevented by the electronic structure. In these conditions it is possible to think in the possibility of filling a 2-D electron band. The remaining problem should be the experimental procedure to fill efficiently these states. In this work the authors have calculated the halfwidth of the first image state of an electron at a vacuum-LiF surface using a self energy formalism. 5 refs., 1 fig., 1 tab.

52244 (CONF-8804141–, pp. 19-26) **Potential barrier for tunneling electrons in STM [scanning tunneling microscope].** Pitarke, J.M. (Euskal Herriko Unibertsitatea, Bilbo (Spain)); Echenique, P.M. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The correct interpretation of vacuum-tunneling experiments achieved with the scanning tunneling microscope (STM) makes it necessary to know about the effective potential barrier that an electron leaving the surface sees. A variety of semiclassical and quantum-mechanical approaches are available to calculate the attractive potential between an external charged particle and a semi-infinite polarizable medium, but local effects are not negligible for the distances of interest, and a simple local formalism cannot be applied, either, so it is necessary to include, at the same time, local and non-local correlations effects. Consequently, the determination of this potential barrier is a difficult task and it remains an open problem. Recently some work has been performed going beyond the local density formalism (LDA). The tunneling current in a metal-vacuum-metal junction is very sensitive to the detailed form of the potential barrier between the electrodes, and specially sensitive are the positions of the transmission resonances which occur in the region close to the metal-vacuum interface where the momentum of the electron can be real, so the tunneling electrons can serve as a probe of this surface-interaction. Indeed, the STM has been used to study the distance-voltage characteristics (d-V_a) in the constant current mode, and tunneling resonances, that is, peaks in the dJ/dV_a curve have been observed in recent experiments, as predicted by Gundlach. Thus, in order to estimate the shape of the potential barrier that electrons feel when they tunnel the vacuum region, the author has carried out theoretical calculations of the dI/dV_a-V_a characteristics for a W(110) tip on a AU(110) sample. 14 refs., 2 figs.

52245 (CONF-8804141–, pp. 27-35) **Elastic and inelastic interaction in STEM [Scanning Transmission Microscope].** Zabala, N. (Universidad del Pais Vasco, San Sebastian (Spain)); Rivacoba, A.; Echenique, P.M. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The recent development of the Scanning Transmission Microscopy (STEM) has stimulated the interest in the interaction of high energy electron beams with small particles and surfaces. When the geometry of the target is simple enough, it is useful to describe the target, in the frame of the classical electrodynamics by means of a dielectric function $\epsilon(\omega)$. Electrons in the beam can be described as classical point particles, or by a quantum wave function. In the classical approach one studies the interaction of the electron with the field induced by itself in the target. 16 refs., 4 figs.

52246 (CONF-8804141–, pp. 37-47) **Excitonic interaction in GaAs/GaA*l*As quantum wells.** Sung, C.C. (Univ. of Alabama, Huntsville (USA)); Mo, G. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

Calculation of excitonic states in GaAs/GaA*l*As quantum wells is applied to analyze the anti-crossing energy levels of observed data of 2s-light-hole and 1s-heavy-hole excitons. It is shown that the difference of the energy levels is determined by the excitonic interaction proportional to the population of the excitons. Various sets of parameters in the literature are used to compare with the data. 6 refs., 1 fig.

52247 (CONF-8804141–, pp. 49-58) **Recoil saturation of the self-energy in atomic systems.** Manson, J.R. (Clemson Univ., SC (USA)); Ritchie, R.H. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

Within the framework of the general self-energy problem for the interaction of a projectile with a many-body system, the authors consider the dispersion force between two atoms or between a charge and an atom. Since the Born-Oppenheimer approximation is not made, this is a useful approach for exhibiting non-adiabatic effects. They find compact expressions in terms of matrix elements of operators in the atomic displacement which are not limited by multipole expansions. 7 refs.

52248 (CONF-8804141–, pp. 59-75) **Review of convoy electron phenomena.** Sellin, I.A. (Univ. of Tennessee, Knoxville (USA)). Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

This brief review emphasizes sharp distinctions between convoy electron production phenomena observed for light ion projectiles ($Z_p \sim 1$, $v_p \sim 1$ au) traversing solid targets with those observed for heavy ion projectiles ($Z_p \gtrsim 10$, $v_p \gtrsim 10$ au). The relative importance of bulk and surface production phenomena for the two cases are discussed in the context of corresponding experimental data. Data concerning an enhanced transport length observed for convoy electrons accompanying the penetration of fast, heavy ions through solids are discussed, and used to set the stage for a corresponding theoretical discussion of the stochastic perturbation of Coulomb orbits in solids, the subject of a companion theoretical discussion by J. Burgdoerfer. 9 refs., 6 figs.

52249 (CONF-8804141–, pp. 77-85) **Transport theory for convoy electrons and Rydberg electrons in solids.** Burgdoerfer, J. (Univ. of Tennessee, Knoxville (USA)). Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

Recent experimental investigations of excitation of near-threshold states in fast ($v_p \gg 1$; v_p: projectile velocity) highly charged ($q \gg 1$, q: ionic charge) ions traversing thin solid targets have revealed several interesting and heretofore unexplained features. For convoy electrons, i.e. electrons in low-energy continuum states in the projectile frame just above threshold, anomalous transport properties as well as a high degree of anisotropy in the angular distribution have been reported. Convoy electrons give rise to a cusp shaped peak in the forward emission spectrum of electrons whose velocity vector $\vec{v}$ matches the projectile velocity, $\vec{v} = v_{\text{convoy}}$. For high Rydberg states just below threshold an abundant population of high ℓ states, absent in ion-atom collisions under otherwise identical conditions of projectile velocity and charge state, has been observed. A quantitative description of the evolution of the atomic charge cloud around fast highly charged ions in solids within the framework of classical transport theory is being developed. This amounts to the solution of a phase space master equation for the distribution function $f(\vec{r}, \vec{v})$ which takes properly into account competing effects of the strong Coulomb field, of screening, and of the stochastic perturbations in the solid due to multiple scattering. A numerical solution can be achieved by solving the associated Langevin equation for individual phase space trajectories and employing Monte Carlo sampling techniques. In

this progress report the author briefly outlines the theoretical framework and presents first results on the transport effects of Coulomb focussing, defocussing and trapping. 6 figs.

52250 (CONF-8804141–, pp. 87-90) **Electron emission from collective excitation of solids by heavy ion impact.** Rothard, H. (J. W. Goethe-Universitaet, Frankfurt (West Germany)); Burkhard, M.; Biedermann, C.; Heil, O.; Hofmann, D.; Kemmler, J.; Koschar, P.; Kroneberger, K.; Groeneveld, K.O. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

Collective excitation of the electron plasma of a solid by a penetrating heavy ion can lead to the emission of low energy electrons. In double differential energy- and angular distributions of secondary electrons from sputter-cleaned solid surfaces from heavy ion impact structures are observed which can be related to 1. wake-induced shock electrons and 2. electrons resulting from the decay of plasmons. The emission of these electrons is strongly influenced by both surface contamination and structure. The directed emission of shock electrons offers the possibility to study the refraction of low energy electrons by the surface potential barrier. 14 refs., 4 figs.

52251 (CONF-8804141–, pp. 91-94) **ECC [electron-capture-to-continuum] cusp shapes for H^+ and H^{++} on atomic and molecular targets.** Bissinger, G. (East Carolina Univ., Greenville (USA)). Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

Recently the results have been published of measurements of zero-degree electron energy spectra with ~MeV/u bare H and He on C_mH_n gases [1] with m = 1, 2, 3, 4, 5 and 7 and observed an abrupt cusp shape change when $m \geq 4$. This cusp shape change, which appeared as a noticeable increase in the sharpness of the cusp peak, was extracted by the straightforward point-by-point subtraction of the scaled CH_4 cusp shape from the other molecular cusp shapes. This difference peak was called the W peak and had the properties that its skewness, FWHM, yield dependence on projectile Z and energy, FWHM dependence on Z_p, and peak position on analyzer angular position differed from both ECC and ELC cusp behaviors. However when the hydrocarbon molecule had $m < 4$, there was no significant cusp shape difference between these cusps and those obtained with atomic Ar targets [2]. This surprising result could not be explained either as an electron-capture-to-continuum (ECC) or electron-loss-to-continuum (ELC) process and hence the only remaining process for forward electron production, Brandt-Ritchie wake model for solids, was applied to the molecular hydrocarbon results with some success. Moreover, further measurements on fluorocarbons showed that the cusp shape, even for the smallest molecule, CF_4, showed evidence of the W peak. Coincidence measurements performed for 2.4 MeV He^{++} with the m = 1-5 hydrocarbon series looking for correlations between the He^+ exit charge state did not show any obvious change in coincidence yield for the m = 4 or 5 hydrocarbon targets. Covering a broad range of molecular targets to examine molecular parameters of possible importance such as size, valence electron density, shape, number of electrons, etc., no parameter appeared to correlate with the presence of the W peak except the number of electrons in the molecule. 5 refs., 4 figs.

52252 (CONF-8804141–, pp. 95-97) **Scanning tunneling microscopy and spectroscopy.** Warmack, R.J. (Oak Ridge National Laboratory, TN (USA)); Ferrell, T.L. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The technique of scanning tunneling microscopy is demonstrated to provide topological as well as spectroscopic information. The three parameters under experimental control are tunneling current (I), tunneling bias (V), and tip altitude (d). By holding one constant and measuring the dependence of the other two, interesting spectroscopic data may be obtained. Differential conductivity (dI/dV) measurements can be interpreted as surface density of states information. An inelastic channel should open at the surface plasmon energy of the material to which tunneling occurs, yielding a peak in dI/dV. Shown are the results of a calculation of the work involved in transporting an electron to a silver film on a silicon slab. The probability of exciting the plasmon for these materials reveals a simple peak very close to the surface plasmon energy for silver. A significant shifting and splitting of this peak would be expected for thin films of other materials where the bulk and surface modes are more widely separated.

52253 (CONF-8804141–, pp. 99) **New directions in scanning-tunneling microscopy.** Ferrell, T.L. (Oak Ridge National Laboratory, TN (USA)); Warmack, R.J.; Reddick, R.C. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The tunneling of electrons in scanning-tunneling microscopy (STM) has permitted imaging of the electronic distribution about individual atoms on surfaces. The need for use of conducting surfaces in STM limits its applicability, and new forms of scanning microscopy have emerged as a result of interest in poorly conducting samples. Atomic force microscopy has demonstrated that the force between a surface and a probe tip can be used to image selected materials. Now being developed are magnetic probe STM's and photon tunneling microscopes in which the probe is a sharpened optical fiber. Also of great interest presently is the measurement of differential conductance of surfaces using electron STM's. This method supplies spectral information and contrast enhancement in images. At present there remains much theoretical work to be carried out in order to better characterize related data on inelastic electron tunneling, and valuable insight may be gained from data being gathered on the local work function of materials. As matters stand today, the key problems lie in determining tip and contamination effects, preparation of samples, and understanding conductivity mechanisms in very thin materials on conducting substrates. Resolution of these problems and introduction of new forms of scanning microscopy may permit novel and important applications in biology as well as surface science.

52254 (CONF-8804141–, pp. 101-112) **Inner-shell excitation by channeled electrons.** Pennycook, S.J. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

An interesting situation occurs when inner shell electrons in crystalline materials are excited by electron beams of kilovolt energies in a transmission electron microscopy. For many years the subsequent x-ray emission has been used as the basis of an analytical technique, giving compositional information at high spatial resolution. Recently this technique has been extended to provide information on impurity lattice site location, the basis of the technique being to take two fluorescence spectra, one under channeling conditions and on random spectrum with the crystal oriented away from strongly channeling planes or axes. Since electrons channel along the positive potential wells of the atomic planes or strings, a higher yield of characteristic x-ray emission is expected from the channel case, for the same incident beam current. The channeling effect can be defined as the relative increase in x-ray yield. Consider for simplicity a nonatomic matrix A and an impurity X which has a substitutional fraction F_s and the remainder is randomly located. Only the fraction F_s of the impurity will show a channeling effect and a quantitative measure of substitutionality has been given. This analysis will only work if the individual inner shells under consideration are excited with equal efficiency under both channeling and random conditions. This is not true for the excitation of more weakly bound shells. For a typical beam energy of 100 keV incident on crystals along a major axis, the width of the

electron distribution about the atomic string is a small fraction of an angstrom. 4 refs., 2 figs.

52255 (CONF-8804141–, pp. 113-141) **Cherenkov x rays: Recent experimental results.** Moran, M.J. (Univ. of California, Livermore (USA)); Schneider, M.B.; Chang, B.; Maruyama, X.K. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

Preliminary experimental results show the measurement of Cherenkov x rays for silicon and carbon foils. The measured distributions demonstrate grazing-angle enhancement of the emission flux, where relativistic electrons are incident on the foils at near-grazing angles. This behavior was predicted in a paper presented at the preceding Werner Brandt Workshop. 7 refs., 16 figs.

52256 (CONF-8804141–, pp. 123-141) **Radiative electron capture [REC].** Vane, C.R. (Oak Ridge National Laboratory, TN (USA)); Datz, S.; Dittner, P.; Giese, J.; Gomez del Campo, J.; Jones, N.; Krause, H.; Miller, P.D.; Schoere, H.; Schulz, M. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

This paper contains experimental data on ion channeling in solids. The x-ray spectrum for 160 MeV sulfur ions passing through a silicon target is given. Peaks are due to target and projectile K x-rays and from L- and L-radiative electron capture (REC) processes in which a target electron is transfered to the L- or K-shell, respectively, of a bare- or one-electron sulfur projectile ion moving in the solid and a photon is emitted which carries away the excess energy.Iso given is (1) the x-ray spectrum for 160 MeV bare sulfur ions axially channeled through silicon, (2) charge state distributions of sulfur ions exiting a silicon crystal in channeling and random orientations, (3) schematic representations of the REC process, (4) cross sections for radiative recombination and REC, (5) REC portions of x-ray spectra for bare sulfur ions channeled axially through a silicon crystal, (6) measured and calculated K-REC peak positions for bare- and one-electron sulfur ions channeled through silicon crystals, (7) measured and calculated widths of the K-REC peaks for bare sulfur ions channeled in silicon crystals, (8) K-REC peak centroid position results for 120 to 130 MeV sulfur 16+, (9) yield of K-REC x-rays from bare sulfur ions channeled through silicon crystals, (10) x-ray spectra generated by bare oxygen ions traversing a hydrogen gas, and (11) comparison between x-ray data and a computer generated simulation based on radiative electron capture from an atomic hydrogen target.

52257 (CONF-8804141–, pp. 143-152) **Optical, mass, and Auger spectra from e-bombarded KBr.** Arakawa, E.T. (Oak Ridge National Laboratory, TN (USA)); Kamada, M. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The authors have measured the mass spectrum and optical emission lines of neutral potassium atoms ejected from KBr at T = 300°K and 443°K bombarded by 2-keV electrons. The room-temperature data may be complicated by the non-stoichiometry of the alkali-enriched sample surface and seem difficult to interpret. The high-temperature sample, which maintains the proper stoichiometry, produces data in support of gas-phase excitation of alkali atoms desorbed from the surface. 15 refs., 4 figs.

52258 (CONF-8804141–, pp. 163-172) **Energy deposition by partially stripped ions.** Crawford, O.H. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The collisional deposition of energy by partially stripped ions, and by neutral atoms, is studied. A projectile with known charge is considered to interact with a target, and the expected excitation energy of the target is calculated in a nonrelativistic high-velocity limit, ignoring exchange. This treatment has its most natural application to the near-surface region of a target; i.e., within a mean free path for changes in the electronic state of the projectile. This work was motivated by interest in light emission from solids under irradiation. In the case of opaque targets, such as metals, any light observed must come from very close to the surface, in which case the treatment given here is applicable. 6 refs. 4 figs.

52259 (CONF-8804141–, pp. 173-180) **Enhanced electron-capture and charge variation of molecular ions.** Steuer, M.F. (Univ. of Georgia, Athens (USA)). Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The following question is asked: For molecular ions moving within a stopping medium, its atomic-ion components separating under the influence of their mutual repulsion, how do the charges of the atomic ions vary with the dept of penetration? To address this question, the author considers a diatomic, homonuclear molecular ion whose center of mass moves with velocity V in a solid. He can describe this molecular ion as a pair of atomic ions having equal nuclear charges, Z, each carrying a number, N(x), of electrons which are bound to their respective centers of force. Let the displacement of nuclear charge Z1 relative to nuclear charge Z2 be described by the internuclear separation R. For a depth of penetration into the solid, x, the internuclear separation, R(x) = R(t), will be determined by the Coulomb explosion between the interacting charges, q1 = q2 = q(x), where q(x) = Z-N(x). The relative motion of the ion pair may be neglected so that each atomic ion moves with the velocity of the center of mass; i.e., V1 = V2 = V. For the present, he restricts consideration to molecular ions whose internuclear axes are aligned parallel with the direction of the beam. 4 refs., 1 fig.

52260 (CONF-8804141–, pp. 182-199) **Sputtering by fast ions using a sum of impulses.** Johnson, R.E. (Univ. of Virginia, Charlottesville (USA)); Sundqvist, B.U.R.; Hedin, A.; Fenyo, D. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

A simple, unifying description of the sputtering of solids by fast ions is given using a sum of impulses. For both electronic and collisional energy deposition the scaling of the yield vs. (dE/dx) is in qualitative agreement with experiment in three different regimes of (dE/dx) for which the nature of the ejection process changes: single events, diffusive spike, and pressure pulse. At very high (dE/dx) a volume ejection mechanism (linearized pressure pulse) is described in which the yield scales as $(dE/dx)^3$ when the ion penetration depth is large. This accounts for the dependence of the measured yield of intact, thermally-labile biomolecules ejected from the solid state, and roughly describes the measured ejection angles for the intact molecular ions. 30 refs., 1 fig.

52261 (CONF-8804141–, pp. 181) **Electronic sputtering.** Johnson, R.E. (Univ. of Virginia, Charlottesville (USA)). Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

Electronic sputtering covers a range of phenomena from electron and photon stimulated desorption from multilayers to fast heavy ion-induced desorption (sputtering) of biomolecules. In this talk the author attempted. Therefore, to connect the detailed studies of argon ejection from solid argon by MeV ions and keV electrons to the sputtering of low temperatures molecular ices by MeV ions then to biomolecule ejection from organic solids. These are related

via changing $(dE/dx)_e$, molecular size, and transport processes occurring in materials. In this regard three distinct regions of $(dE/dx)_e$ have been identified. Since the talk this picture has been made explicit using a simple spike model for individual impulsive events in which spike interactions are combined linearly. Since that time also the molecular dynamics programs (at Virginia and Uppsala) have quantified both single atom and dimer processes in solid Ar and the momentum transport in large biomolecule sputtering. 5 refs.

52262 (CONF-8804141–, pp. 201-205) **Mechanism of H_n^+ and H^- desorption during fast ion bombardment.** da Silveira, E.F. (Texas A & M Univ., College Station (USA)); Schweikert, E.A. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

After emission of electrons and photons, hydrogen species are the next secondary particles to leave the surface of a solid exposed to bombardment of fast ions. Their desorption yield, energy distribution, and angular distribution should reflect the conditions existing near the heavy ion track at 10^{-13} to 10^{-11} seconds after the impact of the projectile. The measurement and analysis of those quantities should thus provide important and perhaps unique information about the mechanism of energy transfer from the projectile to the desorbed species. In this paper, the authors present the relative desorption yields of H^-, H^+, H_2^+, and H_3^+, measured for several surface conditions using ^{252}Cf-Particle Desorption Mass Spectrometry (PDMS). 8 refs., 3 figs.

52263 (CONF-8804141–, pp. 229-240) **A core plasma model of track structure in insulators.** Ritchie, R.H. (Oak Ridge National Laboratory, TN (USA)); Ashley, J.C.; Killough, G. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

How do tracks form on insulators following the passage of swift, densely ionizing particles? The authors use a core plasma model to study the tracks for chlorine ions in silicon dioxide. Particle tracks are narrow, stable chemically reactive centers of strain composed of displaced atoms rather than electronic defects. It is assumed that most of the energy deposited goes into electronic excitation and ionization rather than into nuclear motion. It is concluded that calculations of yields, track radii, etc. as a function of projectile energy need to be made.

52264 (CONF-8804141–, pp. 241-250) **Phase effects for electrons in liquid water and water vapor.** Turner, J.E. (Oak Ridge National Laboratory, TN (USA)); Wright, H.A.; Hamm, R.N.; Ritchie, R.H.; Paretzke, H.G. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The objective of these studies is to compare transport, energy loss, and other phenomena for electrons in water in the liquid and vapor phases. Understanding the differences and similarities is an interesting physics problem in its own right. It is also important for applying the relatively large body of experimental data available for the vapor to the liquid, which is of greater relevance in radiobiology. This paper presents a summary of results from a series of collaborative studies carried out by the authors at Oak Ridge National Laboratory (ORNL) and the Gesellschaft fur Strahlen- und Umweltforschung (GSF). In these studies, identical calculations were performed using two Monte Carlo computer codes: the ORNL code, OREC, for liquid water and the GSR code, MOCA, for water vapor. 4 refs., 14 figs.

52265 (CONF-8804141–, pp. 251-258) **Physical and chemical interactions in irradiated water containing DNA.** Wright, H.A. (Oak Ridge National Laboratory, TN (USA)); Hamm, R.N.; Turner, J.E.; Klots, C.E.; Bolch, W.E. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

When a charged particle interacts with liquid water it undergoes inelastic energy loss events that produce ionizations and excitations of water molecules. The electrons produced during ionization events may have enough energy themselves to produce further ionizations and excitation in slowing down to subexcitation energies. These physical interactions occur very rapidly – within 10^{-15}s in a local region of space – and result in the production of ionized water molecules (H_2O^+), excited water molecules (H_2O^*) and subexcitation electrons. During the prechemistry period to approximately 10^{-12}s chemically reactive ions and radicals are formed. Subsequently, these ions and radicals diffuse through the water and react chemically with each other or with other molecules that may be present in solution. The authors have developed a Monte Carlo computer code to simulate these physical and chemical processes in liquid water. The code transports a charged particle and all of its secondaries through liquid water and tabulates the position and identity of each physical interaction. It then calculates the position and identity of each chemically reactive ion or radical produced in the track. 10 figs.

52266 (CONF-8804141–, pp. 269-280) **An analytic representation of the radial distribution of dose from energetic heavy ions in water, SI, LIF, and NaI.** Katz, R. (Univ. of Nebraska, Lincoln (USA)); Loh, Kim Sum; Huang, Guo Rong. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

An earlier representation of the radial distribution of dose about the path of a heavy ion in liquid water is modified and extended to include silicon, lithium fluoride, and sodium iodide. 6 refs., 5 figs., 1 tab.

52267 (CONF-8804141–, pp. 281-296) **Calculated yields of ammonia in the radiolysis of deoxygenated solutions of glycylglycine.** Bolch, W.E. (Univ. of Florida, Gainesville (USA)); Turner, J.E.; Yoshida, H.; Jacobson, K.B. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

This paper presents detailed Monte Carlo simulations of physical and chemical interactions occurring within electron tracks in deoxygenated solutions of glycylglycine. Hydrated electrons produced within these tracks react with the solute to produce ammonia and a peptide secondary free radical. Calculated yields of ammonia are presented for a range of solute concentrations and electron energies. Excellent agreement is found between calculated and measured yields of ammonia in solutions irradiated by 250-kVp X-rays and ^{60}Co gamma rays. 12 refs., 5 figs.

52268 (CONF-8804141–, pp. 207-227) **On the calculation of wave-number vector- and frequency-dependent dielectric response function for cubic ice.** Zaider, M. (Columbia Univ., New York, NY (USA)); Fry, J.L.; Orr, D.E. Oak Ridge National Lab., TN (USA). Sep 1989. From 11. Werner Brandt workshop on charged particle penetration phenomena; Oak Ridge, TN (USA); 14-15 Apr 1988. In *The 11th Werner Brandt workshop on charged particle penetration phenomena.* 299p. Order Number DE90000959. Source: NTIS, PC A13/MF A01.

The authors give in this paper a description of the formalism, algorithms, and computer techniques necessary for performing a full-scale, ab-initio calculation of the frequency- and wave-number-dependent dielectric response function for water. A number of preliminary results are reported and interpreted vis-a-vis available data. The calculation is performed for cubic ice, basically in order to be able to take advantage of simplifications resulting from the invariance to translation of the system (Bloch's theorem). Two further simplifications resulted from using the random-phase approximation

and a semiphenomenological crystal Hamiltonian to obtain the band structure. 21 refs., 4 figs.

52269 (CONF-9006272–1) **Berry phases and Wyckoff positions for energy bands in solids.** Zak, J. (Technion-Israel Inst. of Tech., Haifa (Israel). Dept. of Physics). Argonne National Lab., IL (USA). [1990]. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 18. international colloquium on group theoretical methods in physics; Moscow (USSR); 4-9 Jun 1990. Order Number DE90017814. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report discusses work on Berry phases and wyckoff positions for energy bands in solids. Talk in this report was limited to simple bands. (JDL)

52270 (CONF-9009261–2) **The development of projectile excitation during ion-solid collisions observed through convoy electron emission.** Elston, S.B. (Tennessee Univ., Knoxville, TN (USA). Dept. of Physics and Astronomy). Oak Ridge National Lab., TN (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC05-84OR21400. From Workshop on fast ion collisions; Debrecen (Hungary); 17-19 Sep 1990. Order Number DE91000725. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Preliminary results and interpretation are presented for a recent experiment designed to explore the evolution of electronic excitation of a projectile ion during flight through a solid target by monitoring the development of high-order multipole moments of the convoy electron angular distribution as a function of target thickness.

52271 (CONF-9009261–3) **Electronic excitations in fast ion-solid collisions.** Burgdoerfer, J. (Tennessee Univ., Knoxville, TN (USA). Dept. of Physics and Astronomy). Oak Ridge National Lab., TN (USA). [1990]. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Workshop on fast ion collisions; Debrecen (Hungary); 17-19 Sep 1990. Order Number DE91000736. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We review recent developments in the study of electronic excitation of projectiles in fast ion-solid collisions. Our focus will be primarily on theory but experimental advances will also be discussed. Topics include the evidence for velocity-dependent thresholds for the existence of bound states, wake-field effects on excited states, the electronic excitation of channeled projectiles, transport phenomena, and the interaction of highly charged ions with surfaces. 44 refs., 14 figs.

52272 (DOE/ER/14090–1) **Pulse propagation in inhomogeneous optical fibers: Progress report, September 15, 1989–September 14, 1990.** Menyuk, C.R. Maryland Univ., Baltimore, MD (USA). This paper discusses research at the University of Maryland on optical fiber switches and the propagation of solutions through the optical fibers. (LSP)

52273 (DOE/ER/45131–8) **[The physics of pattern formation at liquid interfaces]: A survey of recent and current work.** Pittsburgh Univ., PA (USA). [1990]. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER45131. Order Number DE91000856. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper discusses pattern formation at liquid interfaces and interfaces within disordered materials. The particular topics discussed are: a racetrack for competing viscous fingers; an experimental realization of periodic boundary conditions; what sets the length scale for patterns between miscible liquids; the fractal dimension of radial Hele-Shaw patterns; detailed analyses of low-contrast Saffman-Taylor flows; and the wetting/absorption properties of polystyrene spheres in binary liquid mixtures. (LSP)

52274 (DOE/ER/45239–T2) **[Atomic and electronic structure of metals and alloys: Clean surfaces and chemisorbed molecules]: Progress summary.** State Univ. of New York, Stony Brook, NY (USA). Research Foundation. Sep 1990. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER45239. Order Number DE91000267. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In this second period of support we have concentrated exclusively on three subjects, namely, (1) rare earths, bulk and surfaces; (2) ultrathin films of strained metallic phases; and (3) improvement of experimental facilities. In the area of rare earths we have analyzed the photoemission data collected at beamline U7B of the National Synchrotron Light Source from a single-crystal platelet of Tb(0001).

52275 (DOE/ER/45376–2) **Dynamics of surface melting: Progress report, 1 January 1990–31 December 1990.** Elsayed-Ali, H.E. Rochester Univ., NY (USA). Lab. for Laser Energetics. Aug 1990. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER45376. Order Number DE91000978. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The objectives of this program is to study the phenomenon of surface melting of single crystals of metals, to test for its existence, and to investigate its dynamics. Both conventional static electron diffraction and dynamic ultrafast electron diffraction are used in our study. This year, the ultrahigh vacuum facility containing the picosecond electron reflection high-energy electron diffraction system was equipped with a cylindrical mirror analyzer and a static electron gun for Auger spectroscopy. An image analysis system capable of acquiring the pulsed diffraction patterns was assembled and used in analysis of picosecond laser heated surfaces. A large set of time-resolved experiments were conducted to study the thermal response of Pb(110) to picosecond laser heating. The surface Debye-Waller effect was used to time-resolve the evolution of surface temperature. This provided us with a picosecond time-resolved surface lattice temperature probe. Results for laser fluences below surface melting show agreement with a heat-diffusion model. The temperature dependence of the Pb(100) along the [110] and the [001] azimuths using x-ray photoelectron forward scattering of the $4f_{7/2}$ core-level photoelectrons confirmed, for the first time, surface melting of Pb(100) at temperatures as low as 560 K.

52276 (IC–90/95) **Scaling theory of quantum resistance distributions in disordered systems.** Jayannavar, A.M. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 14p. Order Number DE91602866. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

We have derived explicitly, the large scale distribution of quantum Ohmic resistance of a disordered one-dimensional conductor. We show that in the thermodynamic limit this distribution is characterized by two independent parameters for strong disorder, leading to a two-parameter scaling theory of localization. Only in the limit of weak disorder we recover single parameter scaling, consistent with existing theoretical treatments. (author). 32 refs, 4 figs.

52277 (IC–90/114) **Optical properties of metallic Fibonacci quasi-superlattice.** Feng Weiguo (International Centre for Theoretical Physics, Trieste (Italy)); Liu Nianhua; Wu Xiang. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 13p. Order Number DE91602821. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Within the approximation of hydrodynamic model, the optical properties of the metallic Fibonacci quasi-superlattice have been studied for the region of s-polarized soft x-rays and extreme ultraviolet. By using the transfer-matrix method and taking account of damping effects, we have discussed the electromagnetic normal modes for the quasisuperlattice in the rational approximation. The related dispersion curves explain the reflection spectra well, and we found that similar to the reflectivities, both real part and imagine part of the dispersion relation pattern has a rich structure of self-similarity. With the increasing of the generation number, the electromagnetic modes all become critical. (author). 13 refs, 3 figs.

52278 (IC–90/116) **Fixed scale transformation for Ising and Potts clusters.** Erzan, A. (International Centre for Theoretical Physics, Trieste (Italy)); Pietronero, L. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 22p. Order Number DE91602822. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The fractal dimension of Ising and Potts clusters are determined via the Fixed Scale Transformation approach, which exploits both the self-similarity and the dynamical invariance of these systems at criticality. The results are easily extended to droplets. A discussion of inter-relations between the present approach and renormalization group methods as well as Glauber-type dynamics is provided. (author). 20 refs, 7 figs, 2 tabs.

52279 (INP–1377/PL) **Proceedings of 22. Zakopane school on physics, Zakopane, Poland, 1-15 May 1987. Part 2: Part 2. Condensed matter studies by nuclear methods.** Krolas, K.; Tomala, K. (eds.). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1987. 320p. (CONF-8705201–: 22. Zakopane school of physics, Zakopane (Poland), 1-8 May 1987). Order Number DE91602823. Source: NTIS (US Sales Only), PC A14/MF A01; OSTI; INIS.

Separate abstracts were prepared for 4 of the papers in this volume. 1 paper was introduced into INIS system before and the remaining 9 papers were considered outside the subject scope of INIS. (M.F.W.).

52280 (INP–1377/PL, pp. 69-87) **Ion implantation of Te and I ions in Si and GaAs studied by Moessbauer spectroscopy, ion channeling and nuclear orientation.** Langouche, G. (Louvain Univ. (Belgium). Inst. for Nuclear- and Radiationphysics). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1987. (CONF-8705201–: 22. Zakopane school of physics, Zakopane (Poland), 1-8 May 1987). In *Proceedings of 22. Zakopane school on physics, Zakopane, Poland, 1-15 May 1987. Part 2: Part 2. Condensed matter studies by nuclear methods.* 320p. Order Number DE91602823. Source: NTIS (US Sales Only), PC A14/MF A01; OSTI; INIS.

This paper deals mainly with results obtained with Moessbauer spectroscopy and ion channeling on the behaviour of Te and I atoms in semiconductors. The newest results deal with implantations in GaAs. 26 refs., 8 figs., 3 tabs. (author).

52281 (INP–1377/PL, pp. 88-121) **Iron implantation in garnets studied by CEMS, X-ray diffraction at glancing angles and transmission electron microscopy.** Marest, G. (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1987. (CONF-8705201–: 22. Zakopane school of physics, Zakopane (Poland), 1-8 May 1987). In *Proceedings of 22. Zakopane school on physics, Zakopane, Poland, 1-15 May 1987. Part 2: Part 2. Condensed matter studies by nuclear methods.* 320p. Order Number DE91602823. Source: NTIS (US Sales Only), PC A14/MF A01; OSTI; INIS.

Due to their numerous physical properties, garnets are often used in new technologies. Recently it has been shown that high doses implanted ions, chemically reacting with the matrix could give interesting results. If the bulk is completely amorphized after implantation, further annealings can recrystalize it. In this study $Y_3F_5O_{12}$, $Y_3Al_5O_{12}$ and $Gd_3Ga_5O_{12}$ single crystals were 100 keV implanted with ^{57}Fe ions at doses ranging between 10^{16} and 10^{17} ions.cm^{-2}. The iron chemical states were determined thanks to Conversion Electron Moessbauer Spectroscopy (CEMS) and it was shown that the alloying elements of the matrix could influence the nature of the created phases. After thermal treatments the sample superficial layers were characterized using CEMS, glancing angle X-Ray Diffraction (GXRD), Transmission Electron Microscopy (TEM) and Rutherford Backscattering Spectroscopy (RBS). Different annealing stages were put forward: the oxidation of the implanted iron below 650 deg C and the garnet recrystallization around 850 deg C with some iron substitution in the garnet octahedral and tetrahedral sites. The overstoichiometric iron forms particles of mixed oxides $(FeAl)_2O_3$, $(FeGa)_2O_3$ or particles of pure Fe_2O_3 oxide depending on the garnet. For the first time it is proved that after annealing around 1200-1300 deg C a complete rebuilding of the garnet matrix can induce for these oxide particles at room temperature a Morin transition. 44 refs., 29 figs., 3 tabs. (author).

52282 (INP–1377/PL, pp. 137-146) **Recent results of PAC applied to study of magnetic alloys.** Rots, M. (Louvain Univ. (Belgium). Inst. for Nuclear- and Radiationphysics). Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1987. (CONF-8705201–: 22. Zakopane school of physics, Zakopane (Poland), 1-8 May 1987). In *Proceedings of 22. Zakopane school on physics, Zakopane, Poland, 1-15 May 1987. Part 2: Part 2. Condensed matter studies by nuclear methods.* 320p. Order Number DE91602823. Source: NTIS (US Sales Only), PC A14/MF A01; OSTI; INIS.

Two new applications of PAC in the study of magnetism will be introduced. The first topic is devoted to the problem of reentrance behaviour, the nature of which is still controversal especially in the case of AuFe alloys around 18 at%Fe. Recently the applicability of PAC to the study of spin-glass freezing was investigated and the results in the reentrant concentration region were discussed. Here I add new results on the interplay between local atomic order and the appearance of the double magnetic transition: paramagnetic-ferromagnetic-spin glass upon cooling. In the second part I introduce preliminary PAC results on the study of antiferromagnetism in manganese and its alloys. 8 refs., 4 figs. (author).

52283 (INP–1377/PL, pp. 147-155) **Recent developments in PAC surface studies.** Schatz, G. (Konstanz Univ. (Germany, F.R.). Fakultaet fuer Physik); Klas, T.; Platzer, R.; Voigt, J.; Wesche, R. Institute of Nuclear Physics, Cracow (Poland); Uniwersytet Jagiellonski, Cracow (Poland). 1987. (CONF-8705201–: 22. Zakopane school of physics, Zakopane (Poland), 1-8 May 1987). In *Proceedings of 22. Zakopane school on physics, Zakopane, Poland, 1-15 May 1987. Part 2: Part 2. Condensed matter studies by nuclear methods.* 320p. Order Number DE91602823. Source: NTIS (US Sales Only), PC A14/MF A01; OSTI; INIS.

The PAC surface investigations are performed by utilizing the radioactive ^{111}In probes deposited at the copper crystals surfaces. PAC time spectra are shown for the three main orientations of the copper system Cu(111), Cu(100) and Cu(110). 8 refs., 6 figs., 1 tab. (author).

52284 (INT–194/I, pp. 91-99) **Study of the admixtures distribution in solids by residual activity measurement.** Sowa, M. (Uniwersytet Marii Curie-Sklodowskiej, Lublin (Poland). Inst. Fizyki); Szyszko, W.; Sielanko, J. Institute of Physics and Nuclear Techniques, Cracow (Poland). 1986. (In Polish). (CONF-8509466–: Polish symposium on development and application of isotopic methods in engineering and technology, Zakopane (Poland), 11-14 Sep 1985). In *Development and application of isotopic methods in engineering and technology: Proceedings of the Polish Symposium 11-14 September 1985 Zakopane.* 132p. Order Number DE91604461. Source: NTIS (US Sales Only), PC A07/MF A01; OSTI; INIS.

The distributions of As and P admixtures implanted in Si mono- and polycrystals are studied by means of radiochemical and ion etching methods. 12 refs., 5 figs., 1 tab. (M.F.W.).

52285 (KFTI–88-25) **Simulation of sputtering of multicomponent solids by ion bombardment: program system PERST.** Nikiforov, V.I.; Pavlenko, V.I.; Slabospitskij, R.P.; Khirnov, I.V. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 12p. (In Russian). Order Number DE91604880. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Basic version of problem-oriented program system PERST for simulation of sputtering of multicomponent solids by ions heavier than lithium in the kinetic energy range of 50 eV -500 keV at incidence angle of 0-90 deg C is developed. PERST system as a program product is described. Particular attention is paid to automation of programs formation for research work. 13 refs.; 1 fig.; 1 tab.

52286 (KFTI–88-44) **Parametric X radiation of low-energy electrons in monocrystals.** Adejshvili, D.I.; Blazhevich, S.V.; Bochek, G.L.; Lapko, V.P.; Morokhovskij, V.L.; Fursov, G.L.; Shchagin, A.V. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 4p. (In Russian). Order Number DE91602873. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Spectra of parametric X radiation (PR) of E=24 MeV electrons in silicon crystal (the crystal thickness is 240 nm) at an angle of Θ_k=298.4 mrad relatively to electron motion direction ($\Theta_k > mc^2/E$) are measured. The crystal is so oriented that crystallographic plane

(III) is perpendicular to radiation plane and is under Φ angle relatively to direction of relativistic electron motion. PR spectrum has a sharp intensity maximum at $\omega \simeq 13$ keV that is characterized by high monochromaticity. Energy in spectrum maximum is smoothly changed by varying the crystal orientation angle Φ. Dependence of PR maximum intensity energy on the crystal orientation angle Φ with variation of Φ angle near $\Theta_B/2$ is studied. This dependence shows that PR kinematics coincides with that of coherent bremsstrahlung. 9 refs.; 3 figs.

52287 (KFTI–88-45) **Dependence of displacement fields on the damage cluster nucleus geometry.** Grigor'ev, A.N.; Zabela, A.G.; Nikolajchuk, L.I.; Prokhorenko, E.M.; Khizhnyak, N.A. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 7p. (In Russian). Order Number DE91602874. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Displacement fields in doped crystals of cubic and hexagonal structures containing extended defects are studied. The numerical results are presented depending on the damage cluster nucleus geometry. All calculations are based on analytical representations of displacement fields in an integral form using elasticity theory equations. The investigation results are vital for radiation physics as they permit to predict and calculate both the character and geometry of distortions near damaged region cluster and determine cluster parameters on the basis of the known structure of distortions. Dependences are obtained for the following monocrystals: Mg, ZnO, CdS, W, Au. 6 refs.; 3 figs.

52288 (LAFI–151) **Space correlations at radiation-defect storage and aggregation in solids.** Pirogov, F.V. AN Latvijskoj SSR, Riga (USSR). Inst. Fiziki. 1989. 26p. (In Russian). Order Number DE91602875. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Qualitative effects of many-particle correlations for systems with reactions A+B→0 and A+B→A are considered. The influence of generation rate, diffusion coefficient, interaction radii upon the generation-recombination aggregation and sink distribution fluctuations upon the defect space distribution have been studied. A simple method which describes the effect of many-particle correlations in the case of large concentrations is presented. 32 refs.; 1 tab.

52289 (LA-UR–90-2975) **XUV free-electron laser-based projection lithography systems.** Newnam, B.E. Los Alamos National Lab., NM (USA). [1990]. 15p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9007157–2: SPIE conference on EUV x-ray and gamma-ray instrumentation for astronomy, San Diego, CA (USA), 8-13 Jul 1990). Order Number DE91000441. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Free-electron laser sources, driven by rf-linear accelerators, have the potential to operate in the extreme ultraviolet (XUV) spectral range with more than sufficient average power for high-volume projection lithography. For XUV wavelengths from 100 nm to 4 nm, such sources will enable the resolution limit of optical projection lithography to be extended from 0.25 μm to 0.05μm and with an adequate total depth of focus (1 to 2 μm). Recent developments of a photoinjector of very bright electron beams, high-precision magnetic undulators, and ring-resonator cavities raise our confidence that FEL operation below 100 nm is ready for prototype demonstration. We address the motivation for an XUV FEL source for commercial microcircuit production and its integration into a lithographic system, include reflecting reduction masks, reflecting XUV projection optics and alignment systems, and surface-imaging photoresists. 52 refs., 7 figs.

52290 (LA-UR–90-2976) **Photoabsorption modulation in GaAs: $Ga_{1-x}In_x$ as strained-layer superlattices.** Sella, I. (Los Alamos National Lab., NM (USA)); Watkins, D.E.; Laurich, B.K.; Smith, D.L.; Subbanna, S.; Kroemer, H. Los Alamos National Lab., NM (USA). [1990]. 5p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-901105–14: Fall meeting of the Materials Research Society, Boston, MA (USA), 24 Nov - 1 dec 1990). Order Number DE91000440. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Photoabsorption modulation measurements have been made on $Ga_{1-x}In_xAs$ – GaAs strained-layer superlattices using two approaches: In the first the modulating beam and the test beam have the same wavelength (near the exciton resonance). In the second, the modulation wavelength is much shorter than the test beam wavelength. A dramatic difference is observed in the modulated transmission spectra near the excitonic level for the two modulating wavelengths. The difference in behavior can be explained by screening of the residual surface electric field, which only occurs for the high photon energy modulating beam. This beam excites carriers that are free to drift in the surface field before they are captured in the quantum wells. Carriers excited by the low photon energy modulation beam are created in the wells and can not effectively screen the surface field. We describe a model which explains the nonlinear intensity saturation profile and qualitatively describes the spectral line shape. 4 refs., 4 figs.

52291 (LA-UR–90-3129) **Angular dependence of thin-film dielectric coating damage thresholds.** Boyer, J.D.; Foltyn, S.R.; Mauro, B.R.; Sanders, V.E. Los Alamos National Lab., NM (USA). [1989]. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891163–4: 21. annual symposium on optical materials for high power lasers, Boulder, CO (USA), 1-3 Nov 1989). Order Number DE91000237. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Newman et al. reported experiments showing that the angular dependence of 351-nm laser damage thresholds in HfO_2/SiO_2 multilayer dielectric reflectors was much weaker than even the $1/\cos\theta$ expected from simple geometric fluence dilution. Several plausible explanations were suggested, but none were convincing. We propose a simple geometric model based on a cylindrical form for the coating defect responsible for damage initiation. We have measured 248-nm damage thresholds for bare fused silica, evaporated aluminium films, and HfO_2/SiO_2 and Al_2O_3/SiO_2 dielectric reflectors at angles out to 85°. The measured data agree well with our simple model.

52292 (LA-UR–90-3329) **A three-dimensional tight-binding model for trans-polyacetylene.** Wang, X. (Los Alamos National Lab., NM (USA)); Campbell, D.K.; Lin, H.Q.; Vogl, P. Los Alamos National Lab., NM (USA). [1990]. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-9009257–2: International conference on science and technology of synthetic metals, Tuebingen (Germany, F.R.), 2-7 Sep 1990). Order Number DE91000182. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We develop a three-dimensional (3-D) generalization of the one-dimensional (1-D), tight-binding Su-Schrieffer-Heeger (SSH) model for trans-$(CH)_x$. Importantly, the model faithfully reflects the 3-D character of the band-edge states as found in ab initio Local-Density-Approximation (LDA) calculations but remains simple enough to be analytically solvable for the dimerized ground state. We examine the density of states and the optical absorption predicted within this model, paying special attention to the roles of the transverse coupling and the polarization of the probing field.

52293 (LBL–26455, pp. 55) **Optical second-harmonic generation as a surface probe for noncentrosymmetric media.** Stehlin, T.; Feller, M.; Guyot-Sionnest, P.; Shen, Y.R. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

In recent years, optical second-harmonic generation (SHG) has proved to be an effective and sensitive tool for studies of a large variety of surface and interface properties. It has yielded, for example, information about structural and electronic properties of metal and semiconductor surfaces. However, experiments so far have been restricted to substrates with inversion symmetry, since the SHG is forbidden in the bulk but allowed at the surface, giving this technique its unique surface specificity. The authors show in the present work that, with proper polarization combinations, this restriction to media with inversion symmetry can be relaxed. SHG can then be used as an effective surface probe with submonolayer sensitivity for all interfaces accessible by light. For demonstration, the authors have studied with SHG the adsorption of Sn on GaAs,

since semiconductor-metal interfaces are of great interest in fundamental as well as applied semiconductor research.

52294 (LBL–26455, pp. 61) **Multifractal structure of attractors at the quasiperiodic transition to chaos for electron-hole plasma instability in Ge.** Kim, Y. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

The scaling structure of attractors at the transition from quasiperiodicity to chaos has been studied for an electron-hole plasma instability in Ge crystal. The scaling function f(a) spectrum calculated from the time series of the plasma current oscillation at the onset of chaos is in good agreement with that of a circle-map model. The experimental power spectrum also confirms that the transition to chaos is well described by the circle map. The extrinsic noise effect on the f(a) spectrum is discussed by using the circle map.

52295 (LBL–26455, pp. 76) **Incommensurable magnetic surface structures for MnO-type antiferormagnetic insulators.** Chrzan, D.C.; Falicov, L.M. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

A calculation of the magnetic (001) surface structure of an antiferromagnetic insulator with the MnO spin arrangement is reported. The calculation is based on classical spins with Heisenberg interactions that are (a) between second neighbors throughout the bulk and surface, (b) between nearest-neighbor spins at the surface layer, and (c) between nearest-neighbor spins in the first and second layers. It is found that, for a range of exchange parameters, incommensurable ground-state structures are obtained.

52296 (LBL–26455, pp. 77-78) **Work in progress.** Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

An exact solution of a four-site crystal model with periodic boundary conditions, a (001) thin film with face-centered-cubic crystal structure, is being developed for the nickel density of electron states, as would be measured in surface-sensitive valence-band photoemission. The object is to study modifications of the many-body electronic structure in the presence of surfaces. A realistic local-density-approximation one-electron structure and intrasite electron-electron interactions most generally allowed by atomic symmetry are used. The crystal-field effect in the nickel film will be examined. The photoemission spectrum will be calculated and compared with the bulk result. Physical conclusions for true nickel surface many-body states are expected to be obtained.

52297 (LBL–26455, pp. 59-60) **Work in progress.** Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

Optical SHG is being used to study laser thermal desorption of molecules from metal surfaces. Combining the technique with conventional thermal desorption should allow an unambiguous determination of the preexponential factor and the desorption energy. Two interfering laser beams can create a monolayer grating of adsorbed molecules on a surface by laser desorption. This can be monitored by the multiorder diffraction of SHG from the surface. The technique is being used to probe the grating profile. As the molecules diffuse on the surface and the grating smears out, the diffraction signal decays away. The results lead to a determination of the surface-diffusion constant of the molecules. Anisotropy in surface diffusion can also be probed.

52298 (SAND–90-1772C) **Far-infared laser spectroscopy of two dimensional holes in strained-layer heterostructure and superlattices.** Lin, S.Y. (Princeton Univ., NJ (USA). Dept. of Electrical Engineering); Tsui, D.C.; Klem, J.F.; Jones, E.D.; Dawson, L.R. Sandia National Labs., Albuquerque, NM (USA). [1990]. 4p. Sponsored by U.S. Department of Defense; U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Grant 88-0248. (CONF-901105–15: Fall meeting of the Materials Research Society, Boston, MA (USA), 24 Nov - 1 dec 1990). Order Number DE91000027. Source: NTIS, PC A01/MF A01 - OSTI; GPO Dep.

We report far-infrared magneto-transmission data at 4.2 K on a series of p-type strained layer $Al_xGa_{1-x}As/In_yGa_{1-y}As/GaAs$ quantum well (QW) structure and $InAs_{0.15}Sb_{0.85}/InSb$ superlattices (SLS). The $Al_xGa_{1-x}As/In_yGa_{1-y}As/GaAs$ QW structure consists of strained $In_yGa_{1-y}As$ layers of 100 Å in thickness and a space layer having thickness (W_{sp}) ranging from 30 Å to 700 Å. The $InAs_{0.85}/InSb$ SLS was grown on top of a 1.0μm $InAs_{0.15}Sb_{0.95}$ strain relief buffer layer consisting of alternating layers of 100 Å $InAs_{0.15}Sb_{0.85}$ and 200 Å InSb. The detail of the sample structures has been described elsewhere. The two-dimensional (2D) hole density (p_{2D}) of the sample is obtained from the period of the Shubnikov-de Hass oscillations in quantum transport measurements made at 4.2 K. The magneto-transimission experiments are performed in magnetic field (B) up to 8.5 T using polarized radiation and the spectrum is displayed as 4 $Log_{10}[T(B)/T(0)]$, where T(B) is the transmittance at B.

52299 (UCRL–101766) **A high temperature, plasma-assisted chemical vapor deposition system.** Brusasco, R.M. (Lawrence Livermore National Lab., CA (USA)); Britten, J.A.; Thorsness, C.B.; Scrivener, M.S.; Unites, W.G.; Campbell, J.H.; Johnson, W.L. Lawrence Livermore National Lab., CA (USA). Feb 1990. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8911192–7: 1989 Boulder damage symposium, Boulder, CO (USA), 1-3 Nov 1989). Order Number DE91000260. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have designed and built a high-temperature, plasma-assisted, chemical vapor deposition system to deposit multilayer optical coatings of SiO_2 and doped-SiO_2 flat substrates. The coater concept and design is an outgrowth of our recent work with Schott Glasswerke demonstrating the use of plasma assisted CVD to prepare very high damage threshold optical coatings. The coater is designed to deposit up to several thousand alternating quarterwave layers of SiO_2 and doped SiO_2 substrate at deposition rates up to several microns per minute. The substrate is resistively heated to about 1000°C during the deposition phase of the process. The plasma is driven by a 13.56 MHz RF unit capable of producing power densities of up to 140 W cm^{-3} in the reaction zone. The coater is designed to be adaptable to microwave generated plasmas, as well as RF. Reactant gas flow rates of up to 10 slm can be achieved at a 10 tar operating pressure. Reactants consist of O_2, $SiCl_4$ and a volatile halogenated dopant. These gases react in the plasma volume producing SiO_2 with dopant concentrations of up to a few percent. A variable dopant concentration is used to produce index differences between adjacent optical layers.

52300 **Partial least-squares calibration diagnostics applied to the FT-IR analysis of borophosphosilicate glass (BPSG) thin films.** Haaland, D.M. (Sandia National Lab., Albuquerque, NM (US)). pp. 425-426 of Proceedings of the 7th international conference on Fourier transform spectroscopy: Volume 1145. Cameron, D.G. Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1989). pp. 642 DOE Contract AC04-76DP00789. (CONF-890674–: 7. international conference on Fourier transform spectroscopy, Fairfax, VA (USA), 19-23 Jun 1989).

Full-spectrum multivariate calibration methods are capable of providing a multitude of diagnostic capabilities for evaluating the quality of the calibration, identifying problem calibration samples, and flagging unknown samples whose analysis by these methods might be unreliable. These diagnostics are demonstrated for the analysis of BPSG thin films on silicon using infrared spectroscopy and partial least-squares methods.

52301 **Spectral densities of the symmetric Anderson model.** Silver, R.N. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, NM (USA)); Gubernatis, J.E.; Sivia, D.S.; Jarrell, M. *Physical Review Letters (USA),* 65(4): 496-499 (23 Jul 1990).

The spectral density of the single-impurity Anderson model is calculated by a combination of quantum Monte Carlo method to provide data on the Matsubara Green's function, the maximum-entropy method of image reconstruction to invert numerically the

spectral representation, and perturbation theory to provide informative default models. The Kondo central peak of the spectral density is shown to be a universal function of ω/T_K and T/T_K at low frequencies, where T_K is the Kondo temperature. The higher-frequency side peaks are nonuniversal. With decreasing T/T_K the Kondo peak grows as the screened local moment disappears.

52302 **Modeling electron-electron interactions in reduced-dimensional materials: Bond-charge Coulomb repulsion and dimerization in Peierls-Hubbard models.** Campbell, D.K. (Center for Nonlinear Studies, Los Alamos National Laboratory, Los Alamos, NM (USA)); Gammel, J.T.; Loh, E.Y. Jr. *Physical Review, B: Condensed Matter (USA),* 42(1): 475-492 (1 Jul 1990).

To the conventional Peierls-Hubbard model, involving both on-site (U) and nearest-neighbor (V) Coulomb repulsions, we add "off-diagonal" terms, not expressible purely in terms of site densities, representing bond-bond (W) and mixed bond-site (X) electron-electron repulsive interactions involving nearest neighbors. We review earlier analyses of these interactions and discuss relative magnitudes of the parameters in applications to real materials. As a specific illustration, we investigate the effects of the off-diagonal W and X terms on dimerization in the one-dimensional, half-filled-band Peierls-Hubbard models, which have been widely applied to conjugated polymers (such as trans-polyacetylene) and to related quasi-one-dimensional charge-density wave (CDW) systems. Using both weak- and strong-coupling perturbation theory for large systems and exact diagonalizations of small systems, we investigate thoroughly the nature of the ground state of the model. For a broad range of the site-diagonal Hubbard parameters (U,V), including the values believed to be relevant to trans-polyacetylene, we find that the off-diagonal terms (W,X) initially *enhance* dimerization, thereby stabilizing the dimerized [or bond-order-wave (BOW)] ground state. For (unphysically) large values of W relative to U and V, dimerization is destroyed, and the BOW ground state goes over to a ferromagnetic ground state or a CDW ground state, depending on the relative sizes of U, V, and W. We conclude with a general discussion of the applicability of the Peierls-Hubbard models to quasi-one-dimensional materials, including the potential importance of the breaking of charge conjugation ("particle-hole") symmetry by the X term.

52303 **Phase Hamiltonian and depinning electric field in the charge-density wave and the spin-density wave.** Maki, K. (Department of Physics, University of Southern California, Los Angeles, CA (USA)); Virosztek, A. *Physical Review, B: Condensed Matter (USA),* 42(1): 655-659 (1 Jul 1990). DOE Contract FG05-84ER45113.

Making use of the phase Hamiltonian derived from microscopic models, we study theoretically the threshold electric field when the charge-density wave (CDW) or the spin-density wave starts sliding. Unlike earlier phenomenological models, we can describe the temperature dependence of the threshold field. Most of experimental results on the threshold field in quasi-one-dimensional CDW's are interpreted in terms of the three-dimensional CDW. Curious exceptions are the CDW's in $NbSe_3$, which appear to be described better by the two-dimensional CDW.

52304 **Electron transport in the presence of a Coulomb field.** Burgdoerfer, J. (Department of Physics, University of Tennessee, Knoxville, Tennessee 37996-1200 (USA)); Gibbons, J. *Physical Review, A (General Physics) (USA),* 42(3): 1206-1221 (1 Aug 1990). DOE Contract AC05-84OR21400.

We analyze the modifications of the transport behavior of electrons in dense media due to the presence of a strong Coulomb field generated by an ion moving initially in close phase-space correlation with the electrons. These modifications play a profound role in convoy electron emission in ion-solid collisions. The transport behavior is studied within the framework of a classical phase-space master equation. The nonseparable master equation is solved numerically using test-particle discretization and Monte Carlo sampling. In the limit of vanishing Coulomb forces the master equation becomes separable and can be reduced to standard one-dimensional kinetic equations for free-electron transport that can be solved exactly. The comparison to free-electron transport is used to gauge both the reliability of test-particle discretization and the significance of Coulomb distortion of the distribution functions. Applications to convoy-electron emission are discussed.

52305 **Kinetics of short- and long-range B2 ordering in the pair approximation.** Fultz, B. (Department of Materials Science 138-78, California Institute of Technology, Pasadena, California 91125 (USA)). *Journal of Materials Research (USA),* 5(7): 1419-1430 (Jul 1990). DOE Contract FG03-86ER45270.

The kinetic master equation is developed in the pair approximation to study disorder→B2 order transformations in bcc binary alloys. Coupled sets of rate equations for the pair variables are obtained for atom movements by either the direct interchange mechanism or the vacancy mechanism. Numerical integrations provide the nonequilibrium relaxations of short- and long-range order (SRO and LRO), and the vacancy balances between the two sublattices. For binary alloys, disorder→order transformations were studied for all combinations of interatomic interaction strengths, activation barrier heights, and alloy stoichiometry variations. After a transient vacancy relaxation, all cases began with a quick relaxation of SRO, followed later and independently by the growth of LRO and additional SRO. There were some variations in kinetic path through SRO and LRO, moderate variations in overall kinetics, and large variations in vacancy balance. Some non-physical aspects of kinetics in the pair approximation are discussed.

52306 **Two semiempirical expressions for condensed-phase heat capacities.** Tsao, J.Y. (Sandia National Laboratories, Albuquerque, New Mexico 87185-8500 (USA)). *Journal of Applied Physics (USA),* 68(4): 1928-1930 (15 Aug 1990). DOE Contract AC04-76DP00789.

We propose two semiempirical expressions for representing condensed-phase heat capacities over a wide temperature range. Both can be integrated analytically to give closed-form expressions for entropies and enthalpies. As examples, we use the expressions to represent the molar heat capacities, entropies, and enthalpies of ⟨Si⟩ and ⟨Al⟩.

52307 **Ion-surface interaction system (ISIS) for the study of redeposited materials: An application of decelerated ion beams with quartz-crystal microbalances.** Youchison, D.L. (Department of Nuclear Engineering, The Pennsylvania State University, University Park, PA (USA)); Nahemow, M.D. *Review of Scientific Instruments (USA),* 61(8): 2184-2193 (Aug 1990).

The ion-surface interaction system (ISIS) is a facility developed for the study of redeposited fusion impurity control surfaces. It was designed to investigate variations in the sputtering yield and surface binding energy caused by alterations to the surface microstructure. ISIS can create redeposited films similar to that found on tokamak limiters continuously sputtering a target at incident energies representative of a tokamak edge plasma. A duoplasmatron ion source is used to produce well-focused, mass-analyzed 30-keV particle beams of H^+ to Xe^+ with fluxes of 1E15 to 7E15 ions/cm^2 s. These beams are decelerated to the 100–1000 eV range before target impact with currents from 50 to 900 μA. The sputtered neutrals are ionized, accelerated to the incident sputtering energy, and deposited onto another target substrate in a controlled background. The deposited film is then sputtered *in situ* to determine changes in sputtering yield and surface binding energy. The sputtering and redeposition of the ionized sputtered particles is monitored via a unique dual quartz-crystal-microbalance apparatus. As many as eight samples are accommodated in this apparatus by a carousel arrangement that facilitates the redeposition while permitting the exchange of crystals (targets) under vacuum. Targets may be either bulk samples or films evaporated onto planar 4.4-MHz AT-cut quartz crystals. The system is complete with computerized data acquisition, residual gas analysis, and multiple current transducers.

52308 (BNL–45146) **Some aspects of the theory of high temperature superconductors.** Emery, V.J. Brookhaven National Lab., Upton, NY (USA). [1990]. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. DOE/ER. (CONF-900806–10: 19. international conference on low temperature physics, Brighton (UK), 16-22 Aug 1990). Order Number DE91000903. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A qualitative survey of the theory of high temperature superconductors as strongly correlated electron systems is presented. Various microscopic models and their implications for the theory of the normal state are described. Constraints on the mechanism and many body theory of the superconducting state are discussed.

52309 (IC–90/101) **Correlations between frequency of infrared active vibrational modes and copper-oxygen distance in copper oxides, application to superconductors.** Ganguly, P. (International Centre for Theoretical Physics, Trieste (Italy)); Infante, C.; Siddiqi, S.A.; Sreedhar, K. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 26p. Order Number DE91603026. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The infra-red spectra of a large number of ternary Cu(II) oxides with at least a quasi square-planar coordination of oxygen around the copper ions have been studied. The frequency of the bands with the highest frequency, υ_{max}, is found to correlate extremely well with the shortest Cu-O distance. υ_{max} increases at an impressive rate of $\approx$ 20 cm^{-1} per .01 A when the Cu-O distance becomes less than 1.97 A, which is the Cu^{2+}-O^{2-} distance in square-planar CuO_4 complexes as obtained from empirical ionic radii considerations. The marked sensitivity may be used as a "titration" procedure not only to assign bands but also to obtain diagnostic information about local coordination in compounds derived, for example, from the $YBa_2Cu_3O_{7-d}$ structure such as $LaCaBaCu_3O_{7-d}$. The only example where this correlation fails is in the two-layer non-superconducting oxides derived from $La_2(Ca,Sr)Cu_2O_5$. the significance of this result is discussed. The marked dependence of frequency on the bond-distance is qualitatively examined in terms of an increased electron-phonon coupling to account for the observed tendency of the superconducting transition temperature to go through a maximum as the average basal plane Cu-O distance is decreased. (author). 52 refs, 6 figs.

52310 (IS-T–1410) **High-resolution angle-resolved photoemission studies of high $T_c$superconductor $Bi_2Sr_2CaCu_2O_8$.** Liu, Rong. Ames Lab., IA (USA). 21 Sep 1990. 71p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE91000662. Source: NTIS, PC A05/MF A01; OSTI; INIS; GPO Dep.

An angle-resolved photoemission study of the normal and superconducting states in $Bi_2Sr_2CaCu_2O_8$ was performed. Measurements in the normal state show bands dispersing through the Fermi level from at least 350 meV below E_F. The Fermi level crossings are consistant with local-density band calculation, including a point calculated to be of Bi-O character. Additional measurements were made where bands crossed the Fermi level between 100 and 250K, along with measurements on an adjacent Pt foil. The Fermi edges of both materials agree to within the noise. Below the Fermi level, the spectra show correlation effects on the form of an increased effective mass. The shape of the spectra can be explained by a lifetime-broadened photohole and secondary electrons. The effective inverse photohole lifetime is linear in energy. A superconducting gap has been measured at a number of points where there is density at the Fermi level in the normal state. By proper modeling, a gap of 24 meV was obtained for all these points, including points of Cu-O and Bi-O character respectively, according to band calculation. The lack of gap anisotropy in the basal plane suggests that pinning in this material is not d-wave pairing.

52311 (KFTI–88-20) **Critical temperature in the two-zone superconductor model with account of Coulomb repulsion.** Poluehktov, Yu.M. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 8p. (In Russian). Order Number DE91603027. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Superconductor model with two overlapped conductivity resions taking into account both electron-phonon attraction of electrons and their Coulomb repulsion is considered. It is shown that in case when superconductivity occurrence is mainly due to interband scattering processes and Coulomb interaction is defining superconductor critical temperature may sufficiently exceed the critical point possible in electron-phonon interaction. In case of one band and ignoring the Coulomb interaction the obtained formulas are transformed to the earlier known results. 10 refs.

52312 (LBL–26455, pp. 61) **Nonlinear excitations in solid-state systems.** Jeffries, C.D. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

The central objectives of this program are to experimentally study nonlinear phenomena in solid-state systems and to develop models that can explain and predict the observed behavior. This report describes experiments and analysis of spin waves in ferrites and of plasma waves in Ge rods. Present emphasis is on the novel nonlinear electrodynamics exhibited by high-temperature superconductors of the copper oxide type. The origin of the nonlinearities lies in the microstructures of these ceramic materials: superconducting grains in contact through weak links. Observed generic behavior includes very high-order odd harmonic generation in zero dc field; even harmonics in nonzero field; and, at high harmonics and high pump power, very sharp power dips periodic in the dc field, due to flux quantization. Models are developed that semiquantitatively explain the observed behavior and help characterize the material. This work has a bearing on the problem of high critical currents in high magnetic fields, as well as on the origin of the superconductivity.

52313 (LBL–26455, pp. 62) **Harmonic generation and flux quantization in granular superconductors.** Lam, Q.H.; Jeffries, C.D. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

Simple dynamical models of granular superconductors are used to compute the generation of harmonic power in ac and dc magnetic fields. In zero order, the model is a single superconducting loop, with or without a weak link. The sample-average power is predicted by averaging over suitable distribution functions for loop areas and orientations in a dc magnetic field. In a first-order model, inductance and resistance are also included. In all models the power at high harmonics shows strikingly sharp dips periodic in the dc field, revealing flux quantization in the prototype loops.

52314 (LBL–26455, pp. 62) **Nonlinear electrodynamics in the granular superconductor $YBa_2Cu_3O_7$: Experiments and interpretation.** Jeffries, C.D.; Lam, Q.H.; Kim, Y.; Kim, C.M.; Zettl, A.; Klein, M.P. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

For bulk samples of superconducting $YBa_2Cu_3O_7$ powder and pellets subject to a dc magnetic field H_0 and a parallel ac magnetic fields H_1 at frequency $f \sim 10^3$ to 10^5 Hz, the authors report data on the generated harmonic power P(nf) up to harmonic $n \approx 40$, finding: (1) if $H_0 = 0$, only odd harmonic are generated; (2) if $H_0 = 0$, even harmonics are additionally generated; (3) for H_1 sufficiently large ($\gtrsim$ 10 Oe) and n large, then P(nf) vs H_0 displays sharp and deep periodic dips, revealing a remarkably consistent and reproducible macroscopic flux quantization for the bulk sample. These data, as well as the relative intensities of the harmonic power, are found to be in semiquantitative agreement with detailed numerical predictions of a dynamical model of the material as a suitably averaged ensemble of prototype flux quantized loops with weak links. At lower values of H_1, additional structure is observed, related to fluxon pinning and depinning.

52315 (LBL–26455, pp. 62-64) **Work in progress.** Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

Much remains to be done to understand the complex and interesting problem of the electrodynamics of granular superconductors. The phenomena reported here are believed to be generic to $YBa_2Cu_3O_7$. Similar studies are under way on other compounds (e.g., $Bi_4Sr_3Cu_7O_x$), as well as on a variety of forms, including

films, single crystals, and powders and sintered pellets with different grain sizes and methods of preparation. The harmonic-generation studies are sensitive probes of the electrodynamic properties and the microstructure, and may be useful in characterizing materials. The theoretical models are being broadened to take account of the sample geometry, critical state, and fluxon pinning and motion.

52316 (PB–90-253790/XAB) **High-temperature superconductivity in perspective.** Office of Technology Assessment (U.S. Congress), Washington, DC (USA). Apr 1990. 138p. (OTA-E–440). Source: NTIS, PC A07/MF A01.

Also available from Supt. of Docs. See also PB–90-189648.

The report focuses on the technology of superconductivity and its potential applications and warns that U.S. companies are investing less than their main foreign competitors in both low- and high-temperature superconductivity R&D. This is by far the most critical issue affecting the future U.S. competitive position in superconductivity, and in many other emerging technologies. The chapter headings include the following: Executive summary; High-temperature superconductivity–A progress report; Applications of superconductivity; The U.S. response to high-temperature superconductivity; High-temperature superconductivity programs in other countries; Comparison of industrial superconductivity R&D efforts in the United States and Japan–An OTA survey; Policy issues and options.

52317 (BONN-AM–90-05) **Adiabatic evolution, quantum phases, and Landau-Zener transitions in strong radiation fields.** Breuer, H.P.; Dietz, K.; Holthaus, M. Bonn Univ. (Germany, F.R.). Physikalisches Inst. Jul 1990. 18p. (CONF-9006203–:). Order Number DE91706306. Source: NTIS (US Sales Only), PC A03/MF A01.

We develop a method that allows the investigation of adiabatic evolution in periodically driven quantum systems. It is shown how Berry's geometrical phase emerges in quantum optics. We analyse microwave experiments performed on Rydberg atoms and suggest a new, non-perturbative mechanism to produce excited atomic states. (orig.).

52318 (IC–89/281) **Metric equations in geometry and their applications.** Yang Lu (La Trobe Univ., Bundoora (Australia). Dept. of Mathematics); Zhang Jingzhong. International Centre for Theoretical Physics, Trieste (Italy). Sep 1989. 18p. Order Number DE91602693. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

As the generalization of the well-known Cayley-Menger algebra, the general relation among points, hyperplanes and hyperspheres in E^n is proposed. A series of examples are given to show its applications. This study would be greatly helpful to symbolic computation in geometry, including computer-aided geometric reasoning. (author). 9 refs.

52319 (IC–90/44) **Effective actions of 2+1 dimensional gravity and BF theory.** Oda, I. (Chiba Univ. (Japan). Dept. of Physics); Yahikozawa, S. International Centre for Theoretical Physics, Trieste (Italy). Apr 1990. 39p. Order Number DE91602722. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

We develop the perturbation theory of the BF theory, which is equivalent to 2+1 dimensional gravity without a cosmological constant if we take SO(1,2) as the gauge group. We show that the BF theory, which may have a Chern-Simons term, has only tree- or one loop connected Feynman diagrams and that the theory is completely finite (at all orders). We evaluate the effective actions of the BF theory and the generalized BF theory which has a 'cosmological constant' and show that quantum corrections lead to 'Chern-Simons terms', using a BRST invariant regularization based on Pauli-Villars. (author). 19 refs, 4 figs, 2 tabs.

52320 (IC–90/46) **Harmonicity on the tangent bundle.** Vazquez-Abal, M.E. International Centre for Theoretical Physics, Trieste (Italy). Apr 1990. 6p. Order Number DE91602700. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

In the case of real functions of several variables harmonicity of the function implies harmonicity of the components and therefore the property extends to the differential as a function between the corresponding tangent bundles. This problem can be open to arbitrary Riemannian (or pseudo-Riemannian) manifolds (M,g) and (N,h), considering on its tangent bundles TM and TN the corresponding complete lift metrics g^C and h^C respectively. We obtain that the harmonicity of of the maps f: $(M,g)\rightarrow(N,g)$ is equivalent to the harmonicity of the df: $(TM,G^C)\rightarrow(TN,h^C)$. This result gives examples of harmonic maps between pseudo-Riemannian manifolds. (author). 4 refs.

52321 (IC–90/48) **Pattern formation in reaction diffusion systems with finite geometry.** Borzi, C. (International Centre for Theoretical Physics, Trieste (Italy)); Wio, H. International Centre for Theoretical Physics, Trieste (Italy). Apr 1990. 8p. Order Number DE91602701. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

We analyze the one-component, one-dimensional, reaction-diffusion equation through a simple inverse method. We confine the system and fix the boundary conditions as to induce pattern formation. We analyze the stability of those patterns. Our goal is to get information about the reaction term out of the preknowledgment of the pattern. (author). 5 refs.

52322 (IC–90/63) **The local structure of a Liouville vector field.** Ciriza, E. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 20p. Order Number DE91602702. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

In this work we investigate the local structure of a Liouville vector field ξ of a Kaehler manifold (P,Ω) which vanishes on an isotropic submanifold Q of P. Some of the eigenvalues of its linear part at the singular points are zero and the remaining ones are in resonance. We show that there is a C^1-smooth linearizing conjugation between the Liouville vector field ξ and its linear part. To do this we construct Darboux coordinates adapted to the unstable foliation which is provided by the Centre Manifold Theorem. We then apply recent linearization results due to G. Sell. (author). 11 refs.

52323 (IC–90/76) **The subgroups in the special linear group over a skew field that contain the group of diagonal matrices.** Bui Xuan Hai. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 16p. Order Number DE91602703. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

For an arbitrary skew field T we study the lattice of subgroups of the special linear group $\Gamma=SL(n,T)$ that contain the subgroup Δ-SD(n,T) of diagonal matrices with Dieudonne's determinant equal to 1. We show that the description of these subgroups is standard in the following sense: For any subgroup $H,\Delta\leq H\leq\Gamma$ there exists a unique unital net such that $\Gamma(\sigma)\leq H\leq N(\sigma)$, where $\Gamma(\sigma)$ is the net subgroup that corresponds to the net σ and $N(\sigma)$ is the normalizer of $\Gamma(\sigma)$ in Γ. (author). 11 refs.

52324 (IC–90/79) **The normal holonomy group.** Olmos, C. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 10p. Order Number DE91602704. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

The restricted holonomy group of a Riemannian manifold is a compact Lie group and its representation on the tangent space is a product of irreducible representations and a trivial one. Each one of the non-trivial factors is either an orthogonal representation of a connected compact Lie group which acts transitively on the unit sphere or it is the isotropy representation of a single Riemannian symmetric space of rank ≥ 2. We prove that, all these properties are also true for the representation on the normal space of the restricted normal holonomy group of any submanifold of a space of constant curvature. 4 refs.

52325 (IC–90/84) **On the holonomy group of the normal connection.** Olmos, C. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 10p. Order Number DE91602705. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

In this note we are concerned with the problem of irreducible s-representations which can occur as normal holonomy representations of submanifolds of the sphere. We show that almost all s-representations of rank ≥ 2 do actually occur in this way. We study the normal holonomy group of (singular) orbits of s-representations (the so called imbedded R-spaces). 11 refs.

52326 (IC–90/88) **On behaviour of Weyl's gauge field.** Yuan Zhong Zhang. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 19p. Order Number DE91602723. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

We consider a system, consisting of a metric tensor $g_{\mu\nu}$, a scalar field ϕ, a Weyl's gauge field A_μ and a scalar matter field Φ, which is invariant under general coordinate transformation and Weyl's gauge transformation. Two kinds of identities and field equations are given and discussed. A special space-time with $g_{\mu\nu}=\phi^{-2}\eta_{\mu\nu}$ is considered in a gauge-independent manner. We point out that in a correct treatment where $g_{\mu\nu}$ is not regarded as an independent variable, an auxiliary condition for Weyl's gauge field cannot be obtained. Therefore Weyl's gauge field can be treated as a usual field of positive norm. (author). 11 refs.

52327 (IC–90/99) **Quantum theory of single events: Localized de Broglie-wavelets, Schroedinger waves and classical trajectories.** Barut, A.O. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 8p. Order Number DE91602710. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

For an arbitrary potential V with classical trajectories x-vector=g-vector(t) we construct localized oscillating three-dimensional wave lumps ψ(x-vector,t,g-vector) representing a single quantum particle. The crest of the envelope of the ripple follows the classical orbit g-vector(t) slightly modified due to potential V and ψ(x-vector,t;g-vector) satisfies the Schroedinger equation. The field energy, momentum and angular momentum calculated as integrals over all space are equal to particle energy, momentum and angular momentum. The relation to coherent states and to Schroedinger waves are also discussed. (author). 6 refs.

52328 (IC–90/105) **The Hopf fibration over S^8 admits no S^1-subfibration.** Loo, B.; Verjovsky, A. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 20p. Order Number DE91602694. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

It is shown that there does not exist a PL-bundle over S^8 with fibre and total space PL-manifolds homotopy equivalent to CP^3 and CP^7 respectively. Consequently, the Hopf fibration over S^8 admits no subfibration by PL-circles. (author). 27 refs.

52329 (IC–90/106) **Frenet's formulae viewed diagrammatically by the Darboux vector.** Rahman, M.S. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 4p. Order Number DE91602695. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Using the Darboux vector, Frenet's formulae for space curves, plane curves and straight lives are presented in a pattern which makes their mathematical concepts more tangible. 2 refs, 3 figs.

52330 (IC–90/107) **On the role of the Chern-Simons action for the description of the QHE.** Cabo, A. (International Centre for Theoretical Physics, Trieste (Italy)); Oliva, D. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 16p. Order Number DE91602707. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

The role of the Chern-Simons action in the description of the quantum Hall effects is stressed. The 2D-electromagnetic picture of Widom and Srivastava is shown to be valid in a superlattice of 2D-electron gases. A Meissner-like effect appears in such systems. In them, the difference between the external and the integer filling factor fields is exponentially screened by the surface (edge) currents. Also, effective Maxwell equations for one sheet or a superlattice are obtained. (author). 21 refs.

52331 (IC–90/108) **Relativistic quantum Hall conductivity for 3D and 2D electron plasma in an external magnetic field.** Gonzalez Felipe, R. (Grupo de Fisica Teorica ICIMAF, Vedado, La Habana (Cuba)); Perez Martinez, A.; Perez-Rojas, H. International Centre for Theoretical Physics, Trieste (Italy). May 1990. 9p. Order Number DE91602708. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

The complete antisymmetric form of the conductivity tensor in the static limit, as well as the expression for the Hall conductivity, is obtained for the relativistic 3D and 2D electron gas in a magnetic field. The non-relativistic 2D limit is also discussed. The typical step form of the 2D Hall conductivity at zero temperature is obtained under the simple hypothesis of constancy of the chemical potential. (author). 6 refs, 1 fig.

52332 (IC–90/110) **Extendibility of isoparametric submanifolds.** Olmos, C. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 5p. Order Number DE91602696. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

The purpose of this note is to prove that an isoparametric submanifold of the Euclidean space is always contained in a complete one. This is achieved by an inductive argument on the codimension. The method used also gives a simple construction for the Weyl group and a reduction to the spherical case. 7 refs.

52333 (IC–90/112) **A viewpoint on nearly conformally symmetric manifold.** Rahman, M.S. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 10p. Order Number DE91602697. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Some observations, with definition, on Nearly Conformally Symmetric (NCS) manifold are made. A number of theorems concerning conformal change of metric and parallel tensors on NCS manifolds are presented. It is illustrated that a manifold $M = R^{n-1} \times R_+^1$, endowed with a special metric, is NCS but not of harmonic curvature. (author). 8 refs.

52334 (IC–90/117) **L^p continuity of conditional expectations.** Brambila-Paz, F. (International Centre for Theoretical Physics, Trieste (Italy)); Alonso, A. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 16p. Order Number DE91602698. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

A necessary and sufficient condition over a sequence $\{A_n\}_n$ is an element of N of σ-subalgebras that assures L^p-convergence of the conditional expectations will be given. The result generalizes the L^p-martingales, O'Reilly-Fetter and Boylan (equiconvergence) theorems. (author). 5 refs.

52335 (IC–90/120) **Decomposable spaces of recurrent conformal curvature.** Rahman, M.S. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 8p. Order Number DE91602699. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Definitions of a decomposable space, decomposition spaces and a space of recurrent conformal curvature are given. A decomposable space of recurrent conformal curvature V_n, (shortly CK_n) is looked upon as decomposition spaces V_r and V_{n-r}. With this concept some results on decomposable CK_n are derived. (author). 5 refs.

52336 (IC–90/124) **Centrifugal force in Ernst spacetime.** Prasanna, A.R. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 11p. Order Number DE91602720. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

In this we show that in Ernst spacetime which represents the gravitational field of a mass embedded in a magnetic filed, the centrifugal force acting on a particle in circular orbit, reverses its sign twice, once very close to r=3m, and again later at a distance far away from the centre, depending upon the combined values of M and B, the mass and the strength of the magnetic field. The second reversal would mean that beyond a certain distance, depending upon Bm, in Ernst geometry, no Keplerian motion is possible for test particle. This result may have some possible astrophysical consequence. (author). 9 refs, 4 figs.

52337 (IC–90/137) **Covariant formulation of multiple localized quantum measurements.** Diosi, L. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 17p. Order Number DE91602709. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

We have considered the dynamics of simple measuring devices coupled to quantized relativistic Heisenberg-fields. We have defined localized observables and derived covariant equations for the joint probability distribution of the measured outcomes. The proposed formalism is based on standard field-theoretical terms. We have shown that our formalism yields the expected anti-coincidence when two devices detect two wavepackets of a single electron. Applications in the measurement theory of vacuum fluctuations have been suggested. (author). 6 refs, 1 fig.

52338 (IC–90/143) **Is the propagation of electromagnetic radiation in cosmological backgrounds in agreement with the standard model?.** Souza, J.A. International Centre for Theoretical Physics, Trieste (Italy). Jun 1990. 7p. Order Number DE91602721. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

We have found the conditions which a background metric must obey in order that Maxwell equations have a solution depending harmonically on time in it. In particular, for the standard model, these solutions do not exist. (author). 3 refs.

52339 (INS–829) **Space-time dimension of the universe.** Terazawa, Hidezumi. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jun 1990. 16p. Order Number DE91712982. Source: NTIS (US Sales Only), PC A03/MF A01.

Among the three paradigms in which the space-time dimension may be determined, mainly discussed is the one in which the space-time dimension can be taken as a 'dynamical variable' to be determined by the 'Hamilton principle' of minimizing the extended n-dimensional Einstein-Hilbert action of gravitation. (author).

52340 (LAFI–153) **Davydov solitons in chains with quartet anharmonicity.** Kashcheev, V.N. AN Latvijskoj SSR, Riga (USSR). Inst. Fiziki. 1989. 16p. (In Russian). Order Number DE91602706. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Solitary nonlinear waves formed in monomolecular chains with quartet anharmonicity due to the electron interactions with acoustic vibrations of chains are considered. In terms of the Weierstrass elliptic functions periodic solutions have been derived to the corresponding Davydov equations for the modulus of the electron wave function and relative distortion of the chain. Localized solutions of these equations corresponding to the solitons have been found as well. Types of solitary waves corresponding to arbitrary chain anharmonicity have been analyzed. 7 refs.

52341 (LA-UR–90-2947) **Special functions associated with SU(3) Wigner-Clebsch-Gordan coefficients.** Louck, J.D.; Biedenharn, L.C. Los Alamos National Lab., NM (USA). [1990]. 27p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9009265–1: School on symmetry and structural properties on condensed matter, Poznan (Poland), 6-12 Sep 1990). Order Number DE91000446. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Wigner-Clebsch-Gordan (WCG) coefficients of the unitary groups are a rich source of multivariable special functions. The general algebraic setting of these coefficients is reviewed and several special functions associated with the SU(3) WCG coefficients defined and their properties presented. 29 refs.

52342 (LA-UR–90-3055) **Benchmark studies of the Bending Corrected Rotating Linear Model (BCRLM) reactive scattering code: implications for accurate quantum calculations.** Hayes, E.F. (Rice Univ., Houston, TX (USA). Dept. of Chemistry); Darakjian, Z.; Walker, R.B. Los Alamos National Lab., NM (USA). [1990]. 27p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9008159–1: Conference on parallel computation for reaction dynamics, Perugia (Italy), 30 Aug - 1 sep 1990). Order Number DE91000365. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Bending Corrected Rotating Linear Model (BCRLM), developed by Hayes and Walker, is a simple approximation to the true multidimensional scattering problem for reaction of the type: A + BC → AB + C. While the BCRLM method is simpler than methods designed to obtain accurate three dimensional quantum scattering results, this turns out to be a major advantage in terms of our benchmarking studies. The computer code used to obtain BCRLM scattering results is written for the most part in standard FORTRAN and has been reported to several scalar, vector, and parallel architecture computers including the IBM 3090-600J, the Cray XMP and YMP, the Ardent Titan, IBM RISC System/6000, Convex C-1 and the MIPS 2000. Benchmark results will be reported for each of these machines with an emphasis on comparing the scalar, vector, and parallel performance for the standard code with minimum modifications. Detailed analysis of the mapping of the BCRLM approach onto both shared and distributed memory parallel architecture machines indicates the importance of introducing several key changes in the basic strategy and algorithums used to calculate scattering results. This analysis of the BCRLM approach provides some insights into optimal strategies for mapping three dimensional quantum scattering methods, such as the Parker-Pack method, onto shared or distributed memory parallel computers.

52343 (LA-UR–90-3249) **Applications of Maxent to quantum Monte Carlo.** Silver, R.N. (Los Alamos National Lab., NM (USA)); Sivia, D.S.; Gubernatis, J.E.; Jarrell, M. Los Alamos National Lab., NM (USA). [1990]. 16p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9007172–2: MAXENT '90: maximum entropy workshop, Laramie, WY (USA), 30 Jul - 3 aug 1990). Order Number DE91000216. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We consider the application of maximum entropy methods to the analysis of data produced by computer simulations. The focus is the calculation of the dynamical properties of quantum many-body systems by Monte Carlo methods, which is termed the "Analytical Continuation Problem." For the Anderson model of dilute magnetic impurities in metals, we obtain spectral functions and transport coefficients which obey "Kondo Universality." 24 refs., 7 figs.

52344 (LA-UR–90-3344) **Antimatter gravity experiment.** Brown, R.E.; Camp, J.B.; Darling, T.W. Los Alamos National Lab., NM (USA). [1990]. 10p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-901116–4: 11. international conference on the application of accelerators in research and industry, Denton, TX (USA), 5-8 Nov 1990). Order Number DE91000177. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

An experiment is being developed to measure the acceleration of the antiproton in the gravitational field of the earth. Antiprotons of a few MeV from the LEAR facility at CERN will be slowed, captured, cooled to a temperature of about 10 K, and subsequently launched a few at a time into a drift tube where the effect of gravity on their motion will be determined by a time-of-flight method. Development of the experiment is proceeding at Los Alamos using normal matter. The fabrication of a drift tube that will produce a region of space in which gravity is the dominant force on moving ions is of major difficulty. This involves a study of methods of minimizing the electric fields produced by spatially varying work functions on conducting surfaces. Progress in a number of areas is described, with stress on the drift-tube development.

52345 (LBL–29312) **Current and potential distributions on a cylinder electrode.** Grabowski, A.J. Lawrence Berkeley Lab., CA (USA). Jul 1990. 92p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE91000170. Source: NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This work presents the numerical solution for the current and potential distributions of a cylindrical electrode. In particular, it investigates the primary current distribution, the secondary current distribution with linearized kinetics, and the potential distribution due to constant current density on the working electrode. 16 refs., 19 figs.

52346 (PHE–86-13, pp. 206-214) **Einstein causal quantum fields on lattices with discrete Lorentz invariance.** Baumgaertel, H. (Akademie der Wissenschaften der DDR, Berlin (German Democratic Republic). Karl-Weierstrass-Inst. fuer Mathematik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). In *Proceedings of the 20. international symposium on the*

theory of elementary particles. 405p. Order Number DE90706237. Source: NTIS (US Sales Only), PC A18/MF A01; OSTI; INIS.

Results on rigorous construction of quantum fields on the hypercubic lattice Z^4 considered as a lattice in the Minkowski space R^4 are presented. Two associated fields are constructed: The first one having on the lattice points of Z^4 is causal and Poincare invariant in the discrete sense. The second one is an interpolating field over R^4 which is pointlike, translationally covariant and spectral in such a manner that the 'real' lattices field is the restriction of the interpolating field to Z^4. Furthermore, results on a rigorous perturbation theory of such fields are mentioned.

52347 (PHE–86-13, pp. 226-243) **Two cosmological aspects of interacting quantum field theory: Particle production and CPT non-invariance.** Lotze, K.H. (Jena Univ. (German Democratic Republic). Sektion Physik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). The electromagnetic and the π^0 - 2γ - model interactions are investigated in spatially flat Robertson-Walker universes. Simultaneous creation of photons and electron-positron pairs as well as the decays $\gamma \rightarrow e^+e^-$ and $\pi^0 \rightarrow 2\gamma$ are studied in detail. It is found that the electromagnetic interaction is a source of cosomological photons and that the creation of 'free' Dirac particles exerts an attenuating influence on their production due to interaction with photons. Both decay processes are not CPT invariant if (i) the expansion of the universe provides a T-asymmetric background and (ii) the conditions for free-particle creation are fulfilled for at least one quantum field participating in the interactions. (author).

52348 (PHE–86-13, pp. 244-255) **On the Schwinger-De Witt expansion for the Feynman propagator in a curved space-time.** John, R.W. (Akademie der Wissenschaften der DDR, Berlin (German Democratic Republic). Zentralinstitut fuer Astrophysik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). The Feynman propagator in curved space-time is defined in a manifestly covariant way by the help of the Schwinger-De Witt representation. Building elements of the Schwinger-De Witt expansion are obtained on a model space-time being of non-constant curvature and yielding not identically vanishing Hadamard coefficients. The world function can be calculated exactly and in closed form for special representatives of highly symmetric space-time only.

52349 (PHE–86-13, pp. 256-270) **Quantum theory of gauge fields in Robertson-Walker spacetime.** Basler, M. (Jena Univ. (German Democratic Republic). Sektion Physik). Akademie der Wissenschaften der DDR, Berlin-Zeuthen (German Democratic Republic). Inst. fuer Hochenergiephysik. Dec 1986. (CONF-8610472–: International symposium on the theory of elementary particles, Ahrenshoop (German Democratic Republic), 13-17 Oct 1986). Exploiting the Lagrange multiplier formalism developed by Kugo and Ojima we give a canonical quantization scheme for non-Abelian gauge theories in curved spacetime. As a first step in a general study of cosmological particle production we investigate the production of non-interacting particles and show, that unphysical particles are absent from the spectrum of particles produced by the gravitational field. (author).

52350 (UCRL-ID–104090) **REMAP: A computer code that transfers node information between dissimilar grids.** Shapiro, A.B. Lawrence Livermore National Lab., CA (USA). Apr 1990. 26p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE91000073. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

REMAP is a computer code that transfers the axisymmetric, two dimensional planar, or three dimensional temperature field from one finite element mesh to another. The meshes may be arbitrary as far as the number of elements and their geometry. REMAP interpolates or extrapolates the node temperatures from the old mesh to the new mesh using linear, bilinear, or trilinear isoparametric finite element shape functions. REMAP is used to transfer the temperature field from a thermal analysis mesh to a more finely discretized structural analysis mesh when performing a thermal stress analysis. REMAP was designed to be used with the finite element heat transfer codes TOPAZ2D and TOPAZ3D, and the solid mechanics codes NIKE2D and NIKE3D. The I/O formats in REMAP can be easily modified to accept input from other codes (e.g., finite difference) and generate output files for other structural codes. REMAP can be used to transfer any scalar field variable between dissimilar finite element meshes. The idea of a coarse filter by a fine filter to determine which element from the old mesh contains a node point from the new mesh was used. The coarse filter determines a subset of elements from the old mesh that may contain the new node point. The fine filter determines the element that contains the new node point. REMAP uses the ray-surface intersection algorithm developed for the FACET code for the fine filter. This algorithm has the added capability to determine which element the node is closest to if the node point lies outside the perimeter of the old mesh. Once an element from the old mesh has been identified as containing or closest to the new node point, the natural coordinates for the node point are calculated. The isoparametric finite element shape functions are calculated next. These shape functions are then used to interpolate or extrapolate the temperatures from the nodes comprising the old element to the new node point.

52351 (UCRL-ID–104558) **TOPAZ2D heat transfer code users manual and thermal property data base.** Shapiro, A.B.; Edwards, A.L. Lawrence Livermore National Lab., CA (USA). May 1990. 188p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE91000075. Source: NTIS, PC A09/MF A01 - OSTI; GPO Dep.

TOPAZ2D is a two dimensional implicit finite element computer code for heat transfer analysis. This user's manual provides information on the structure of a TOPAZ2D input file. Also included is a material thermal property data base. This manual is supplemented with The TOPAZ2D Theoretical Manual and the TOPAZ2D Verification Manual. TOPAZ2D has been implemented on the CRAY, SUN, and VAX computers. TOPAZ2D can be used to solve for the steady state or transient temperature field on two dimensional planar or axisymmetric geometries. Material properties may be temperature dependent and either isotropic or orthotropic. A variety of time and temperature dependent boundary conditions can be specified including temperature, flux, convection, and radiation. Time or temperature dependent internal heat generation can be defined locally be element or globally by material. TOPAZ2D can solve problems of diffuse and specular band radiation in an enclosure coupled with conduction in material surrounding the enclosure. Additional features include thermally controlled reactive chemical mixtures, thermal contact resistance across an interface, bulk fluid flow, phase change, and energy balances. Thermal stresses can be calculated using the solid mechanics code NIKE2D which reads the temperature state data calculated by TOPAZ2D. A three dimensional version of the code, TOPAZ3D is available. The material thermal property data base, Chapter 4, included in this manual was originally published in 1969 by Art Edwards for use with his TRUMP finite difference heat transfer code. The format of the data has been altered to be compatible with TOPAZ2D. Bob Bailey is responsible for adding the high explosive thermal property data.

Since the 1988 Symposium on Fusion Technology, steady progress has been made in the US Magnetic Fusion Energy Program. The large US tokamaks have reached new levels of plasma performance with associated improvements in the understanding of transport. The technology support for ongoing and future devices is similarly advancing with notable advances in magnetic, rf heating tubes, pellet injector, plasma interactive materials, tritium handling, structural materials, and system studies. Currently, a high level DOE review of the program is underway to provide recommendations for a strategic plan.

Dept. of Physics. 24 May 1990. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER53175. Order Number DE91000598. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Research on this grant is devoted to the calculation of heavy particle collision cross sections needed for diagnostic studies of magnetic fusion plasmas. This work requires the development and testing of new theoretical methods, with the implementation of benchmarked techniques to collisions pertinent to fusion reactors. Within the last context, we have provided charge-exchange-recombination cross sections to specific n,1-levels for diagnostic studies on TFTR and for a major compilation for IAEA. We have also completed a cross section study related to the planned neutral beam current drive for ITER. In addition, calculations were completed to assess the use of He neutral atom angular scattering measurements for JT-60. Also, new theoretical methods have been developed to more accurately calculate cross sections involving either He or H_2 targets and partially stripped multiply-charged ions.

52354 (DOE/ER/53188–7) **Experimental investigations of electron capture from atomic hydrogen and deuterium by alpha particles: Annual progress report, 15 September 1989–14 September 1990.** Missouri Univ., Rolla, MO (USA). [1990]. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER53188. Order Number DE91000594. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We have undertaken a program at the University of Missouri-Rolla to experimentally determine cross sections for ion-atom collisions of interest in fusion reactor development. During the last grant period, we have made measurements of total and singly-differential cross sections for the alpha double-capture reaction. $He^{++} + He(ls^2) \rightarrow He(\Sigma n,\ell) + He^{++}$. Collisions of this type have been discussed as a basis for diagnostics in which alphas are neutralized in a single collisions either by a HeI beam or by the ablative cloud from mechanically introduced impurity pellets. We are now finishing measurements of cross sections for the alpha single capture reaction $He^{++} + He(1s^2) \rightarrow He^{+}(n) + He^{+}(1s)$, and propose to study $He^{++} + H(1s) \rightarrow He^{+}(n) + H^{+}$ during next year. Accurate knowledge of these cross sections is fundamental for modeling of neutral-hydrogen beam penetration in fusion plasmas as well as for spectroscopic diagnostics of alpha densities and velocity distributions, especially for the case of capture into the n = 4 state of the projectile He^{+}. Our measurements are made using a unique collision spectrometer discussed in this paper.

52355 (DOE/ET/53088–455) **Nonlinear saturation of ideal interchange modes in a sheared magnetic field.** Beklemishev, A.D. Texas Univ., Austin, TX (USA). Inst. for Fusion Studies. Sep 1990. 45p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-80ET53088. (IFSR–455). Order Number DE91000575. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Pressure-driven ideal modes cannot completely interchange flux tubes of a sheared magnetic field; instead, they saturate, forming new helical equilibria. These equilibria are studied both analytically and numerically with reduced MHD equations in a flux-conserving Lagrangian representation. For unstable localized modes, the structure of the nonlinear layer generated around the resonant flux surface depends on the value of Mercier parameter D_M. Its width is found to be proportional to the position of the inflection point on the linear eigenfunction. Perturbed surfaces in equilibrium always have folds, i.e., areas where the direction of the original reduced magnetic field is reserved. But only far from the instability threshold does the internal structure of the nonlinear layer resemble 'bubble' formation. The appearance of sheet currents and island-like structures along the resonant flux surface may be of interest for the description of forced reconnection in models with finite resistivity. Analytic results are found to be in agreement with 2-D numerical simulations. This study also includes the case of ballooning instability by representing nonlocal driving terms through the matching parameter Δ', which defines the outer boundary conditions for the interchange layer. 12 refs., 9 figs.

52356 (GA-A–20099) **Plasma diagnostics for the DIII-D divertor upgrade.** Hill, D.N. (Lawrence Livermore National Lab., CA (USA)); Futch, A.; Buchenauer, D.; Doerner, R.; Lehmer, R.; Schmitz, L.; Klepper, C.C.; Menon, M.; Leikind, B.; Lippmann, S.; Mahdavi, M.A.; Schaffer, M.; Smith, J.; Salmonson, J.; Watkins, J. General Atomics, San Diego, CA (USA). Oct 1990. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER51114 ;AC05-84OR21400 ;W-7405-ENG-48 ;AC0 (CONF-900557–16: 8. topical conference on high-temperature plasma diagnostics, Hyannis, MA (USA), 6-10 May 1990). Order Number DE91000936. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The DIII-D tokamak is being upgraded to allow for divertor biasing, baffling, and pumping experiments. This paper gives an overview of the new diagnostics added to DIII-D as part of this Advanced Divertor Program. They include tile current monitors, fast reciprocating Langmuir probes, a fixed probe array in the divertor, fast neutral pressure gauges, and H_α measurements with TV cameras and fiber optics coupled to a high resolution spectrometer. 9 refs.

52357 (IAE–4631-6) **Effect of plasma wave dispersion on spatial increment of beam instability.** Kachalov, K.O.; Popkov, N.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1988. 8p. (In Russian). Order Number DE91602942. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Plasma-beam instability of a magnetized ribbon electron beam and warm anisotropic plasma has been investigated. Linear theory of the problem is considered. Dependences of spatial growth rate on the ratio of transverse and longitudinal temperature and beam thickness have been obtained. The growth rate was found to be maximum for the first symmetrical oscillation mode. The parameter characterizing the effect of finite electron beam geometry on the growth rate has been also determined. 5 refs.; 5 figs.

52358 (IAE–4900-7) **Study on superfast deuterium Z-pinch at the ANGARA-5-1 device.** Batyunin, A.V. (and others); Bulatov, A.N.; Vikharev, V.D. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1989. 11p. (In Russian). Order Number DE91602909. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

2-3 MA superfast deuterium Z-pinch with 100 ns pulse rise time is investigated at the ANGARA-5-1 device. The neutron yield in the experiments reaches 10^{12} per pulse. A high axial gradient of the ion number per unit length $dN/dx \simeq 10^{18}$ cm^{-3} results in acceleration of some ions and anisotropy of the neutron energy spectrum. 13 refs.; 4 figs.

52359 (IAEA-CN–53/E-3-11) **Fast-wave current drive modelling for large non-circular tokamaks.** Batchelor, D.B. (Oak Ridge National Lab., TN (USA)); Goldfinger, R.C.; Jaeger, E.F.; Carter, M.D.; Swain, D.W.; Ehst, D.; Karney, C.F.F. Oak Ridge National

Lab., TN (USA). [1990]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-901025–9: 13. international conference on plasma physics and controlled nuclear fusion research, Washington, DC (USA), 1-6 Oct 1990). Order Number DE91000562. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

It is widely recognized that a key element in the development of an attractive tokamak reactor, and in the successful achievement of the mission of ITER, is the development of an efficient steady-state current drive technique. Fast waves in the ion cyclotron range of frequencies hold the promise to drive steady-state currents with the required efficiency and to effectively heat the plasma to ignition. Advantages over other heating and current drive techniques include low cost per watt and the ability to penetrate to the center of high-density plasmas. The primary issues that must be resolved are: can an antenna array be designed to radiate the required spectrum of waves and have adequate coupling properties? Will the rf power be efficiently absorbed by electrons in the desired velocity range without unacceptable parasitic damping by fuel ions or α particles? What will the efficiency of current drive be when toroidal effects such as trapped particles are included? Can a practical rf system be designed and integrated into the device? We have addressed these issues by performing extensive calculations with ORION, a 2-D code, and the ray tracing code RAYS, which calculate wave propagation, absorption and current drive in tokamak geometry, and with RIP, a 2-D code that self-consistently calculates current drive with MHD equilibrium. An important figure of merit in this context is the integrated, normalized current drive efficiency. The calculations that we present here emphasize the ITER device. We consider a low-frequency scenario such that no ion resonances appear in the machine, and a high-frequency scenario such that the deuterium second harmonic resonance is just outside the plasma and the tritium second harmonic is in the plasma, midway between the magnetic axis and the inside edge. In both cases electron currents are driven by combined TTMP and Landau damping of the fast waves.

52360 (IPP–5/34) **Scalings and plasma profile parameterisation of ASDEX high density ohmic discharges.** McCarthy, P.J. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)); Kardaun, O.J.W.F.; Murmann, H.; Lackner, K.; Riedel, K.S. ASDEX Team. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). May 1990. 52p. Grant DE-FG02-86ER53223. Order Number DE91706328. Source: NTIS (US Sales Only), PC A04/MF A01.

A database of high density ($.3 < \text{anti } n_e/10^{20}\ m^{-3} < .8$), low q_a ($1.9 < q_a < 3.4$), Ohmic discharges from the ASDEX experiment is analysed statistically. Bulk parameter scalings and parameterised temperature and density profile shapes are presented. The total plasma kinetic energy, assuming $T_i = T_e$, scales as anti $n_e^{.54\pm.01}$ $I_p^{.90\pm.04}$ and is independent of B_t. The electron temperature profile peaking factor scales as $T_0^{3/2}/\langle T^{3/2}\rangle = .94\ (\pm^{.04})q_a^{1.07\pm.04}$ in close agreement with the assumption of classical resistive equilibrium. In the inner half of the plasma, the inverse fall-off length for both temperature and density has a strong dependence on q_a, with the temperature dependence being more pronounced. Outside the half radius the q_a dependence disappears but the density profile broadens near the edge with increasing plasma current. A second database of moderate density, moderate q_a discharges is presented for comparison. (orig.).

52361 (IPP–5/35) **A statistical approach to plasma profile analysis.** Kardaun, O.J.W.F. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)); McCarthy, P.J.; Lackner, K.; Riedel, K.S. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). May 1990. 43p. Grant DE-FG02-86ER53223. Order Number DE91706329. Source: NTIS (US Sales Only), PC A03/MF A01.

A general statistical approach to the parameterisation and analysis of tokamak profiles is presented. The modelling of the profile dependence on both the radius and the plasma parameters is discussed, and pertinent, classical as well as robust, methods of estimation are reviewed. Special attention is given to statistical tests for discriminating between the various models, and to the construction of confidence intervals for the parameterised profiles and the associated global quantities. The statistical approach is shown to provide a rigorous approach to the empirical testing of plasma profile invariance. (orig.).

52362 (ITEF–71-89) **γ-diagnostics of dense plasma.** Latyshev, S.V.; Rudskoj, I.V.; Cheblukov, Yu.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Teoreticheskoj i Ehksperimental'noj Fiziki. 1989. 7p. (In Russian). Order Number DE91602935. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

It is shown that by the intensity of γ radiation occuring as a result of heavy ion high-intensity beam interaction with the solid-state target nuclei a conclusion can be made concerning the bremstrahlung properties of plasma produced theirwith. Besides it is stressed that nuclear γ radiation contains information concerning changes of density, scattering during plasma heating. It is shown that at the modern technical level there exists a principle possibility of conducting experiments using nuclear γ radiation for hot solid-state plasma diagnostics. 3 refs.; 1 fig.

52363 (JAERI-M–90-088) **MTX microwave-electric-field diagnostic.** Odajima, Kazuo (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Ohasa, Kazumi; Shiho, Makoto. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1990. 69p. Order Number DE91712986. Source: NTIS (US Sales Only), PC A04/MF A01.

A joint Japan-U.S. project is in progress to measure the high electric fields produced by a free-electron laser beam of GW-peak-power level when injected into the plasma of the Microwave Tokamak Experiment (MTX) at the Lawrence Livermore National Laboratory in California. In this report, we discuss the planned method of measurement and the status of the work. The equipment needed is either well along in the design stage or is being built. We plan to test out the combined operation of all components in Japan before shipping to Livermore. Although the measurement appears difficult for a variety of technical and physics reasons, calculations indicate that it should be possible. (author).

52364 (JAERI-M–90-105) **Design of neutron diagnostic for MTX.** Ogawa, Toshihide (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Oasa, Kazumi; Hoshino, Katsumichi; Odajima, Kazuo; Maeda, Hikosuke. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1990. 22p. Order Number DE91713055. Source: NTIS (US Sales Only), PC A03/MF A01.

A neutron diagnostic system was designed for the Microwave Tokamak Experiment being carried out at the lawrence Livermore National Laboratory. High speed measurements are important to this experiment. Plastic scintillator is used for this fast response detection of neutron. Proportional counters and fission counters are used for the total neutron emission rate measurements. (author).

52365 (KFK–4696) **High resolution shock-capturing scheme for numerical simulation of plasma-shock interaction.** Gupta, N.K.; Munz, C.D.; Goel, B. Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik. Apr 1990. 98p. Order Number DE91706327. Source: NTIS (US Sales Only), PC A05/MF A01.

This report describes a one dimensional hydrodynamic computer code in Lagrangean geometry based on high resolution upwind schemes. The code has 1st order as well as 2nd order upwind scheme options and can accomodate any given, analytical or tabular equation of state. The code is tested against a number of test problems for which either analytical or numerical solutions from well tested computer codes or both are available in literature. A brief summary of these comparisons is presented in this report. The predictions of this code are compared with the result of the often used von-Neumann prescription of shock capturing. The results of the present code are free from unphysical oscillations which are typical of von-Neumann procedure. The code is used to simulate the 1-dimensional hydrodynamic and thermodynamic behaviour of plasma irradiated by an intense ion beam. The absence of the spurious oscillations in the results of the present code is especially advantageous to study the effects of temporal non-uniformities of the beam. The second order upwind scheme resolves shocks much steeper than the 1st order one and is therefore recommended for shock wave experiment analysis. For a typical pinch

reflex diode pulse of proton beam on aluminium target upwind results predict compressions of about 10-15% higher as compared to von-Neumann procedure. The upwind results are believed to be closer to reality because this method does not involve any artificial pressure term. (orig.).

52366 (KFTI–88-24) **On a peculiarity of dispersion equation for gyrotropic plasma waveguide.** Onishchenko, I.N.; Sotnikov, G.V. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 5p. (In Russian). Order Number DE91602949. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Dispersion equation of gyrotropic plasma waveguide for parameter range when transverse wave numbers defining radial field structure are complex is derived. Example of dispersion equation solution is presented. Radial structure of longitudinal electric field in the range of complex and actual arguments of radial functions is presented. 3 refs.; 2 figs.

52367 (KFTI–88-30) **Acceleration of charged particles by plasma oscillations in laminated plasma.** Balakirev, V.A.; Novikov, V.E.; Tkach, Yu.V. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 8p. (In Russian). Order Number DE91602950. Source: NTIS (US Sales Only), PC A02/MF A01; OSTI; INIS.

Dynamics of electron acceleration by periodic sequence of plasma resonances in laminated plasma is studied. For synchronization of oscillation phase in separate resonances their possible excitation by modulated electron beam is considered. Consideration is carried out in the specified beam current approximation. Conditions at which particles fall within conditions of unlimited acceleration are found. 7 refs.; 4 figs.

52368 (KFTI–88-32) **Study on the plasma oscillations in the one-slid electromagnetic trap.** Vdovin, S.A.; Lavrent'ev, O.A.; Storozhenko, Yu.O. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 12p. (In Russian). Order Number DE91602951. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Experiments on studying plasma potential oscillations in electromagnetic trap are described. The values of the density gradients, potential and plasma temperature are measured, functional dependences of temperature and potential are studied. Method of correlation analysis is used to determine frequency spectrum of oscillations, phase rate values and direction of oscillation propagation. Two types of instability - a long-wave ion-acoustic and drift low-hybrid one are detected. Anomalous electron transfer results from existence of these instabilities in electromagnetic trap. 10 refs.; 10 figs.

52369 (KFTI–88-39) **Mechanisms of metal impurity release during HF-heating in the URAGAN-3 torsatron.** Grigor'eva, L.I. (and others); Konovalov, V.G.; Kotsubanov, V.D. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1988. 17p. (In Russian). Order Number DE91602922. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Possible mechanisms responsible for the metal impurity release during ICRF production and heating of a plasma are studied with the URAGAN-3 torsatron. It is shown that the edge plasma potential oscillations at the pumping frequency and its harmonics produce an impurity influx from the surface of the helical winding casings (Fe, Cr). The impurity release from the antenna surface (Ti) is caused by a quasisteady ion flux arising in the divertor magnetic flux region during the RF pulse. 21 refs.; 11 figs.

52370 (LA-UR–90-3345) **Complete fluid equations for low-n singular modes in axisymmetric toroidal plasmas.** Glasser, A.H. Los Alamos National Lab., NM (USA). [1990]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-900807–1: Joint Varenna-Lausanne international workshop on theory of fusion plasmas, Varenna (Italy), 27-31 Aug 1990). Order Number DE91000176. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The goal of this work is to develop a complete linear theory of the singular region, including all important dynamical effects. The present phase of the work treats the more collision fluid regime. A later phase will treat the less collisional gyrokinetic regime. This paper concerns the derivation and form of the fluid equations for the singular region of low-n modes. Later work will treat high-n ballooning modes. In addition, the ordering in the present work must be amended before it is applicable to the neighborhood of the field reversal surface of the RFP.

52371 (PPPL–2717) **Alpha particle destabilization of the toroidicity-induced Alfven eigenmodes.** Cheng, C.Z. Pacific Northwest Lab., Richland, WA (USA). Oct 1990. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE91000486. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The high frequency, low mode number toroidicity-induced Alfven eigenmodes (TAE) are shown to be driven unstable by the circulating and/or trapped α-particles through the wave-particle resonances. Satisfying the resonance condition requires that the α-particle birth speed $v_\alpha \geq v_A/2|m-nq|$, where v_A is the Alfven speed, m is the poloidal model number, and n is the toroidal mode number. To destabilize the TAE modes, the inverse Landau damping associated with the α-particle pressure gradient free energy must overcome the velocity space Landau damping due to both the α-particles and the core electrons and ions. The growth rate was studied analytically with a perturbative formula derived from the quadratic dispersion relation, and numerically with the aid of the NOVA-K code. Stability criteria in terms of the α-particle beta β_α, α-particle pressure gradient parameter (ω_*/ω_A) (ω_* is the α-particle diamagnetic drift frequency), and (v_α/v_A) parameters will be presented for TFTR, CIT, and ITER tokamaks. The volume averaged α-particle beta threshold for TAE instability also depends sensitively on the core electron and ion temperature. Typically the volume averaged α-particle beta threshold is in the order of 10^{-4}. Typical growth rates of the n=1 TAE mode can be in the order of $10^{-2}\omega_A$, where $\omega_A=v_A/qR$. Other types of global Alfven waves are stable in D-T tokamaks due to toroidal coupling effects.

52372 (PPPL–2718) **Partially linearized algorithms in gyrokinetic particle simulation.** Dimits, A.M.; Lee, W.W. Princeton Univ., NJ (USA). Plasma Physics Lab. Oct 1990. 35p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE91000492. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In this paper, particle simulation algorithms with time-varying weights for the gyrokinetic Vlasov-Poisson system have been developed. The primary purpose is to use them for the removal of the selected nonlinearities in the simulation of gradient-driven microturbulence so that the relative importance of the various nonlinear effects can be assessed. It is hoped that the use of these procedures will result in a better understanding of the transport mechanisms and scaling in tokamaks. Another application of these algorithms is for the improvement of the numerical properties of the simulation plasma. For instance, implementations of such algorithms (1) enable us to suppress the intrinsic numerical noise in the simulation, and (2) also make it possible to regulate the weights of the fast-moving particles and, in turn, to eliminate the associated high frequency oscillations. Examples of their application to drift-type instabilities in slab geometry are given. We note that the work reported here represents the first successful use of the weighted algorithms in particle codes for the nonlinear simulation of plasmas.

52373 (PPPL–2721) **Weak turbulence theory of collisionless trapped electron driven drift instability in tokamaks.** Hahm, T.S.; Tang, W.M. Princeton Univ., NJ (USA). Plasma Physics Lab. Oct 1990. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE91000505. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The toroidal collisionless trapped electron modes are analyzed in the weak turbulence regime treating both ions and trapped electrons nonlinearly in the presence of ion and electron temperature gradients. The spectral intensity of the density fluctuations in the nonlinearly saturated state is analytically obtained from the steady state solution of the wave-kinetic equation. Distant nonlinear interactions between low-k_θ and high-k_θ modes of similar frequencies via trapped electron scattering (the resonance between the beat

wave and the trapped electron precession drift frequencies) suppress the low-k_φ [$k_\varphi \rho_s \ll (L_n/R)^{1/2}$] modes while close interactions via ion Compton scattering (nonlinear ion Landau damping) produce a monotonically decreasing spectrum from $k_\varphi \rho_s \cong (L_n/R)^{1/2}$ to $k_\varphi \rho_s \cong 1$ according to an approximate power law k_φ^{-3}. Various fluctuation amplitudes at saturation and the fluctuation-induced anomalous particle and heat fluxes are found to be smaller than the mixing length estimates. The plasma confinement is predicted to improve with higher T_i/T_e, more peaked density profile, larger aspect ratio, and higher plasma current. Also, a significant dependence of transport on the electron temperature gradient is found which could contribute to the rigidity of the electron temperature profile often experimentally observed.

52374 (PPPL–2722) **Burning plasmas.** Furth, H.P. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Goldston, R.J.; Zweben, S.J.; Sigmar, D.J. Princeton Univ., NJ (USA). Plasma Physics Lab. Oct 1990. 60p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE91000506. Source: NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

The fraction of fusion-reaction energy that is released in energetic charged ions, such as the alpha particles of the D-T reaction, can be thermalized within the reacting plasma and used to maintain its temperature. This mechanism facilitates the achievement of very high energy-multiplication factors Q, but also raises a number of new issues of confinement physics. To ensure satisfactory reaction operation, three areas of energetic-ion interaction need to be addressed: single-ion transport in imperfectly symmetric magnetic fields or turbulent background plasmas; energetic-ion-driven (or stabilized) collective phenomena; and fusion-heat-driven collective phenomena. The first of these topics is already being explored in a number of tokamak experiments, and the second will begin to be addressed in the D-T-burning phase of TFTR and JET. Exploration of the third topic calls for high-Q operation, which is a goal of proposed next-generation plasma-burning projects. Planning for future experiments must take into consideration the full range of plasma-physics and engineering R&D areas that need to be addressed on the way to a fusion power demonstration.

52375 (PPPL–2723) **Observation of temperature dependent transport in TFTR.** Efthimion, P.C.; Mansfield, D.K.; Stratton, B.C.; Synakowski, E.; Bhattacharjee, A.; Biglari, H.; Diamond, P.H.; Goldston, R.J.; Hegna, C.C.; McCune, D.; Rewoldt, G.; Scott, S.; Tang, W.M.; Taylor, G.; Waltz, R.E.; Wieland, R.M.; Zarnstorff, M.C. Princeton Univ., NJ (USA). Plasma Physics Lab. Oct 1990. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE91000504. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Local particle and heat transport coefficients have been measured in a controlled temperature scan of neutral-beam-heated plasmas with n, I_p, and B_φ held constant. The electron particle transport is ascertained from a general flux analysis of a small density perturbation, and the heat transport is obtained from the equilibrium power balance. The local particle and heat transport coefficients vary as T_e^α, where $\alpha = 1.5–2.5$. The observed temperature dependence for these plasmas is predicted by numerical calculations of anomalous transport due to trapped-particle drift-type microinstabilities.

52376 (TRITA-EPP–90-01) **Laboratory experiments on the magnetic field and neutral density limits on CIV interaction.** Axnaes, I.; Brenning, N. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics. Mar 1990. 41p. Order Number DE91602940. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Laboratory experiments are reported which determine the magnetic field and neutral density limit for Critical Ionization Velocity (CIV) interaction in the impact configuration. A combination of microwave interferometry and spectroscopy has been used to measure how the electron energy distribution varies with the neutral density and the magnetic field strength. The efficiency of the CIV process is evaluated in terms of the efficiency factor η of energy transfer to the electron. This efficiency is studied as function of the ratio V_A/V_0 between the Alfven velocity and the plasma stream velocity and the ratio ν_i/ω_{gi} between the ionization frequency and the ion gyro frequency. With other parameters kept constant, V_A/V_0 is proportional to the square root of the magnetic field, while ν_i/ω_{gi} is proportional to the neutral density. We have found that these two dimensionless parameters are coupled in such a fashion that a stronger magnetic field can compensate for a lower neutral density. For our strongest magnetic field, corresponding to $V_A/V_0 \approx 4$, CIV interaction is found to occur for a comparatively low value $\nu_i/\omega_{gi} \approx 0.1$. For $V_A/V_0 = 1$, we found a clear absence of CIV interaction even for ν_i/ω_{gi} approaching unity. (authors).

52377 Proceedings of the 6th topical conference on high temperature plasma diagnostics. 92p. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

Topics covered in this book include: The TFTR Mirnov system, Spectra from a cooling/warming blackbody, and absorption spectroscopy of a laser produced plasma.

52378 Electron-excited molecules in nonequilibrium plasma. Proceedings of the Lebedev Physics institute, Academy of Sciences of the USSR. Volume 179, supplemental volume 2. Sobolev, N.N. 272p. Nova Science Publishers, Inc., Commack, NY (USA) (1989).

This book focuses on electron-excited molecules in nonequilibrium Plasma. Topics covered include: Distributions of electron-excited molecules over vibrational-rotational levels in gas discharge: Formation mechanisms; Electron-impact excitation levels of molecules electron states in gas discharge; and Doppler spectral line broadening and the velocity distributions of excited atoms and molecules in nonequilibrium plasma.

52379 Filtered x-ray diodes for imploding plasma experiments. Young, F.C. (Naval Research Lab., Washington, DC (USA)); Stephanakis, S.J.; Scherrer, V.E. pp. N19 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses imploding plasmas that provide intense sources of sub keV and keV x-rays for x-ray for x-ray laser experiments. X-ray diodes (XRD's) can be used to measure the power and energy of such radiation. XRD's with appropriate ulthrathin filters and selected cathode materials have been developed to measure specific spectral characteristics of x-rays from implosions driven by MA level currents on Gamble II. For Ar implosions, L-shell emission (0.2-0.46 keV) from Ne-like thru B-like ionization stages is measured with an Al-cathode XRD filtered with 0.7-μm Ti. For Ne implosions, emission of the single He-α line 0.92 keV has been measured with a Ni-cathode XRD filtered with 1.0-μm Cu, and a peak power of 50 GW has been observed. For Na, the He-α line at 1.13 keV is the pump for a Na/Ne matched-line photopumped x-ray laser. A Cu-cathode XRD filtered with 2.0-μm Ge can be used to measure this single line for Na implosions.

52380 Plasma density and poloidal field measurements on text using an injected lithium beam. West, W.P. (GA Technologies, Inc., Oak Ridge, TN (USA)). pp. I3 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses spectroscopy of an injected Li beam that has been used to determine both the plasma density profile and the poloidal field profile on the TEXT tokamak. The neutral Li beam is injected at energies up to 95 keV and both collisional and laser-induced fluorescence is observed during a tokamak shot. Radial and temporal profiles are obtained during a complete shot. The applicability of this technique to larger tokamaks depends on several parameters including (but not limited to) beam penetration, reliablity, spatial/temporal resolution, and signal-to-noise ratio. Because this basic technique obtains local measurements, it is also applicable to nonsymmetric devices. Such applications are discussed.

52381 Deconvolution of H-alpha profiles measured by Thompson scattering collecting optics. LeBlanc, B. (Princeton Univ., NJ (USA)); Grek, B. pp. J6 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses that optically fast multichannel Thomson scattering optics that can be used for H-alpha emission profile measurement. A technique based on the fact that a particular volume element of the overall field of view can be seen by many channels, depending on its location, is discussed. It is applied to measurement made on PDX with the vertically viewing TVTS collecting optics (56 channels). The authors found that for this case, about 28 Fourier modes are optimum to represent the spatial behavior of the plasma emissivity. The coefficients for these modes are obtained by doing a least-square-fit to the data subjet to certain constraints. The important constraints are non-negative emissivity, the assumed up and down symmetry and zero emissivity beyond the liners. H-alpha deconvolutions are presented for diverted and circular discharges.

52382 Ion temperatures and poloidal rotation in Alcator C plasmas. Benjamin, R.D. (Johns Hopkins Univ., Baltimore, MD (USA)); Moos, H.W.; Terry, J.L. pp. J5 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses a high resolution, photon-counting detector, sensitive in the spectral region from 1200 Å to ~2000 Å, that has been mounted on the focal plane of a 1m Ebert-Fastie spectrometer for emission line shape studies. The detector is a microchannel plate based image intensifier which is fiber optically coupled to a linear self-scanning photodiode array. The resolving power of the spectrometer-detector system is ~5300 at 1200 Å and ~12,900 at 1800 Å. The results of the ion temperature studies, calculations of the Zeeman contribution to the measured line shapes and measured poloidal rotation velocities are presented.

52383 Magnetic field measurement based on Zeeman effect in charge exchange recombination excited lines. Wroblewski, D. (Johns Hopkins Univ., Baltimore, MD (USA)); Moos, H. pp. J9 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper suggests that the local magnetic field in a tokamak may be deduced from the analysis of polarization of light impurity ion lines excited by charge exchange recombination process. Profiles of visible lines of hydrogen-like carbon and oxygen are calculated with the use of a simple model which includes the fine structure, Doppler broadening and Zeeman effect. It is shown that, with appropriate polarization analyser and experiment geometry, the components of magnetic field, can be measured.

52384 The JET soft x-ray diode array diagnostic. Edwards, A.W. (JET Joint Undertaking, Abingdon (UK)); Gill, R.D.; Oord, E.; Fahrbach, H.U.; Weller, A.; Zasche, D.; Granetz, R.; Tsuji, I. pp. K5 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses that arrays of silicon diodes installed on Jet measure the plasma soft x-ray emission with high temporal and spatial resolution, allowing mhd effects to be investigated. The diagnostic consists of two pin-hole cameras which view the same toroidal cross-section in orthogonal directions.

52385 The TFTR vertical x-ray imaging system. Johnson, L.C. (Princeton Univ., NJ (USA)); Bitter, M.; Chouinard, R.; von Goeler, S.; Hill, K.W.; Liew, S.L.; McGuire, K.; Pare, V.; Sauthoff, N.R.; Young, K.M. pp. N2 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses a vertically viewing x-ray imaging system, in conjunction with the existing 64-channel horizontal system on TFTR that permits two-dimensional tomography of soft x-ray emissivity, measurement of plasma (major) radial position, improved measurement of MHD phenomena and disruptions, and the possibility of measurement of Shafranov shifts, on a 10 μsec time scale. The compact, helium-filled x-ray camera employs four eight-channel silicon detector modules and views the plasma through a 3-mil thick beryllium window, providing 6 cm position resolution at the center. An x-ray absorber foil changer permits energy selection to match the horizontal XIS. Lead and hydrogenous shielding reduce noise from thermonuclear neutrons and associated gamma rays.

52386 Spectroscopic and interferometric measurements of laser-plasma produced blast waves. McClean, E.A. (Naval Research Lab., Washington, DC (USA)); Stamper, J.A.; Ali, A.W.; Ripin, B.H.; Manka, C.K.; Griem, H.R. pp. J11 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses a laser-produced plasma that generates blast waves as it expands supersonically into a stationary photoionized background gas (N_2) at a pressure of 1-5 Torr. Using a combination of spectroscopic and interferometric measurements, time- and space- resolved values of the temperature and density are obtained. This study was performed with lasers energies of 20-120 J and pulse durations of ~5 nanoseconds. A 1-m spectrograph equipped with three photomultiplier channels; which are calibrated on an absolute scale is used for the spectroscopic measurements. The interferometry is done with a folded-wavefront interferometer. It uses an optical probe pulse that is split off of the main laser pulse, reduced in pulse duration (~300 ps), frequency-doubled to be in a convenient wavelength range, and time-delayed. Interferometric measurements can be made simultaneously with the spectroscopic measurements. Experimental data and the technique of analysis will be shown.

52387 High intensity lithium beam for Zeeman spectroscopy. Weber, P.G. (Los Alamos National Lab., NM (USA)); Masamune, S. pp. J10 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses how the Zeeman spectrum of neutral lithium introduced to hot plasma as a beam may be used to determine both the magnitude and direction of the local magnetic field. Dye lasers can improve the sensitivity either by intracavity absorption, or by resonance fluorescence. A limit of this diagnostic is set by lithium density in the plasma. A high density, 80 kV lithium beam has been developed for plasmas of larger dimension and/or higher densities, or to permit measurements with better time resolution than with previous beams. The beam utilizes a high density lithium ion source. Diagnostics include 2-D ion beam profiling, Faraday cup, magnetic analyzer and a pepperpot probe for measurements of beam intensity, composition and divergence. Beam currents can exceed 10 mA in a $\leq$2 cm diameter beam with a divergence of several mrad. Examples of parameter scans are presented.

52388 Radiaton diagnostics for x-ray laser experiments on Proto II. Spielman, R.B. (Sandia National Labs., Albuquerque, NM (USA)); Dukert, R.J.; Hammel, B.A.; Hanson, D.L.; Palmer, M.A. pp. N18 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses x-ray laser experiments on the Sandia Proto-II accelerator that use a wide array of radiation diagnostics. Precise x-ray measurements are difficult in the environment of a large pulsed power accelerator. Machine shock, EMP, and large x-ray fluences are significant problems. X-ray diodes and resistive

bolometers provide excellent time-resolved information. Crystal and grazing-incidence grating spectrographs and x-ray pinhole camera give time-integrated data. Using micro-channel plates or a scintillator and streak camera system to obtain time resolution are addressed. Precise alignment, nanosecond time resolution and high spectral precision are all needed for successful x-ray laser experiments. Descriptions of the diagnostics and data taken on recent x-ray laser experiments are presented.

52389 **SPRED spectrograph upgrade: High resolution grating and improved absolute calibration.** Stratton, B.C. (Princeton Univ., NJ (USA)); Bartolick, J.; Fonck, R.J.; Ida, K.; Jaehnig, K.P.; Ramsey, A.T. pp. J15 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses two improvements to the SPRED multichannel EUV spectrographs used on TFTR and PBX; A new 2100 g/mm grating covering the 100-320 Å0 region with 0.4 Å resolution (FWHM) has been added to the existing 450 g/mm grating (100-1100 Å with 2.0 Å resolution), and the TFTR SPRED has been absolutely calibrated using synchrotron radiation from the NBS SURF II facility and branching ratio measurements; the PBX system has been calibrated using branching ratios and line ratios from charge exchange recombination excited lines. The availability of high resolution spectra in the 100-320 Å range allows more reliable measurements of metallic ion emissions and, when the instrument views across a neutral beam as in PBX, provides a complete spectroscopic inventory of both low- and high-Z impurities in a single discharge.

52390 **High-yield direct drive experiments at Nova.** Lane, S.M. (Lawrence Livermore National Lab., CA (USA)); Cable, M.D.; Prussin, S.G.; Glendinning, S.G.; Munro, D.H.; Hatchett, S.P.; Estabrook, K.G.; Suter, L.J.; Richardson, M.C.; McKenty, P.W.; Roback, D.; Verdon, C.P. pp. K17 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses a series of direct drive implosions of D-T filled, glass microballons initiated in an effort to produce intense neutron sources for diagnostics development. In particular, neutron sensitive streak camera, and fuel ρr by both neutron activation and neutron spectroscopy could be more easily tested with these simple targets than high density targets that initially are not expected to produce such high yields. Targets with nominal dimensions of 10000μm x 2μm which contained D-T at 12-14 atm were imploded with 18 kJ of 0.35μm light from the 10 beam NOVA system. For pulse widths of 1ns in either converging or diverging geometry, fusion yields in excess of 1013 have been obtained. The yields are comparable to those predicted from numerous 1d-model calculations in spite of the asymmetric illumination geometry of the driver.

52391 **Studies of subnanosecond x-ray switching and shuttering techniques.** Wark, J.S. (Rochester Univ., NY (USA). Lab. for Laser Energetics); Hauer, A.; Kilkenny, J.D. pp. N16 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses experimental studies conducted of the changes in x-ray diffraction properties of crystals under intense subnanosecond laser heating. One beam of the PHOENIX laser system was used to create an intense source of x-ray line radiation. This radiation was in turn diffracted from a silicon crystal that was heated with the other beam of the laser. The diffracted radiation was temporally resolved with an x-ray streak camera. The diffracted lines are observed to broaden spectrally on a subnanosecond time scale. From the temporal structure of the diffrated radiation, information is derived on the nature of the laser heating process. Interruption of crystal diffraction on a subnanosecond time scale is potentially useful as mechanism for x-ray switching and shuttering. Considerations for the design and construction of such devices are discussed.

52392 **The TFTR diagnostic natural beam.** Schilling, G. (Princeton Univ., NJ (USA)); Kozub, T.A.; Medley, S.S.; Young, K.M. pp. K1 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses a neutral beam designed and fabricated to aid in the measurement of ion temperatures of hot, dense TFTR plasmas. The injected fast neutral atoms have a twofold advantage: penetration to the plasma center considerably increases charge exchange neutralization of thermal plasma ions, leading to a localized enhancement of the thermal neutrals efflux into charge exchange neutral analyzers (CENA); and charge exchange recombination of intrinsic impurity ions, C or O, with fast neutral allows Doppler broadening and shift measurements of the emitted light (CHERS) to determine both the impurity ion temperature and toroidal rotation with unbalanced beam heating. Those features of the beam unique to its function as a diagnostic tool and initial measurements on TFTR are presented.

52393 **Measurement of 0.1-3 KeV x-rays from laser plasmas.** Kornblum, H.N. (Lawrence Livermore National Lab., CA (USA)); Kauffman, R.L.; Smith, J.A. pp. N24 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper describes absolute measurements of x-ray spectra made from 0.1-1.5 keV produced by plasmas from targets irradiated by the LLNL Nova laser. These measurements were made using a 15-channel K- and L-edge filtered x-ray diode system. Valid interpretation of the results from this type of diagnostic requires some care in eliminating the effect of channel response at photon energies higher than the absorption edge. Significant errors can occur if this is disregarded. The authors discuss the techniques used and the magnitude of the effects observed. Integrated x-ray energy in the 1.5-3 keV region is inferred from the results.

52394 **A large field, 200-psec gated microchannel plate detector.** Eckart, M.J. (Lawrence Livermore National Lab., CA (USA)); Hanks, R.L.; Kilkenny, J.D.; Pasha, R.A.; Wiedwald, J.D.; Hares, J.D. pp. J17 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses a 15-mm-wide gated microchannel plate detector for uv and x-ray detection that has been built and tested. The detector is part of a 6-ohm transmission line driven by an electronically generated gating pulse. The microchannel plate is coated with CsI allowing tests with a frequency-quadrupled 1.05-μm laser. Results of tests using a high repetition rate, 4-ω laser show optical gate width down to 200 psec FWHM.

52395 **Spectral measurements from laser-produced plasma in OMEGA.** Burkhalter, P.G. (Naval Research Lab., Washington, DC (USA)); Newman, D.A.; Rosen, L.; Hudson, K.; Richardson, M.; Audebert, P. pp. N17 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses curved and flat-diffraction crystal spectrographs developed to collect x-ray spectra from high-atomic number elements (cadmium-rare earths) in the 5-19 Å region. The plasma source was generated by the 24-beam, frequency-tripled light of the OMEGA laser system. The spectral patterns for Cd, Sn, Ce and other rare earth elements were identified with the aid of atomic structure calculations to be predominately 3d-4p, 4f transitions over a range of ionization stages involving the M-shell.

52396 Diagnostic applications of the TFTR XIS system. McGuire, K. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Colchin, R.J.; Fredrickson, E.; Hill, K.; Johnson, L.C.; Sauthoff, N.; Von Goeler, S.; Pare, V. pp. N3 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the horizontal TFTR x-ray imaging system (XIS), an array of 64 silicon surface barrier x-rays diodes, with a 2.5 cm spatial resolution. The XIS system is primarily used to study MHD instabilities, but also been used to measure electron thermal diffusivity, impurity transport, electron temperature, the radius of the q = 1 surface, plasma vertical position and toroidal rotation of the plasma. Movable absorber foil arrays provide energy selection. Band-pass analog filters and digital techniques have been used on the x-ray signals in an attempt to infer turbulence levels in the plasmas. Details of these techniques are presented.

52397 Probes for edge plasma studies of TFTR. Manos, D.M. (Princeton Univ., NJ (USA)); Budny, R.V.; Kilpatrick, S.; Zweben, S. pp. L2 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses TFTR probes designed to study the interaction of the plasma with material surfaces such as the wall and limiters, and to study the transport of particles and energy between the core and edge. Present probe heads have evolved from prototypes in PLT, PDX (PBX), and the initial phase of TFTR operation. The newest heads are capacble of making several simultaneous measurements and include Langmuir probes, heat flux probes, magnetic coils, rotating calorimeter fast ion probes, sample exposure specimens. The authors describe these probe heads and presents some of the data they and their prototypes have acquired. They empphasize measurement of transient plasma during heating, compression, and free-expansion, and fluctuations in the edge plasma.

52398 X-ray spectroscopic methods for the diagnosis of laser imploded targets. Yaakobi, B. (Rochester Univ., NY (USA). Lab. for Laser Energetics); Barnouin, O.; Richardson, M.C.; Sources, J.M.; Hauer, A. pp. M3 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses several methods involving x-ray spectroscopic methods for diagnosing laser-imploded targets. The first method involves the recording of absorption lines formed in the target tamper, out of the continuum emitted by a hotter compressed core. This method is applied to ablatively imploded targets having a thin KCL signature layer. The tamper $\rho\Delta R$ is deduced from the area within the absorption lines, whereas the tamper temperature is deduced from the intensity distribution among absorption lines of adjacent charge states. In second method, doubly diffracting crystals give two-dimensional monochromatic images of thin signature layers in spherical targets. Such information is useful in studying stability and mixing. Experimental results relevant to these methods will be shown and the limitations on their application to laser-target experiments are discussed.

52399 High energy x-ray microscopy with multilayer reflectors. Underwood, J.H. (Lawrence Livermore National Lab., CA (USA)). pp. M2 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper describes some of the recent progress in making and evaluating x-ray reflectors, and outlines the optical design considerations for multilayer-coated microscopes. Results from a prototype multilayer K-B microscope are presented.

52400 Simple models of pinhole closure in high-energy-density experiments. Harrach, R.J. (Lawrence Livermore National Lab., CA (USA)). pp. N32 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses analytical models describing the closure of diagnostic collimators and windows in high energy density experiments. The time-dependent transmission through an aperture of intense signals present in these experiments is controlled by the opacity of the ablation plasma produced by the signal itself. The author discusses self- similar hydrodynamic solutions applicable to the problem; theoretical models of opacity and equation-of-state for the warm plasma region (1-100 eV temperature, expanded-matter densities) of interest; comparison of the analytical model expressions for aperture transmission vs. time with the results of comprehensive one- and two-dimensional hydrocode calculations.

52401 Optical fiducials for x-ray streak cameras at LLE. Jaanimagi, P.A. (Rochester Univ., NY (USA). Lab. for Laser Energetics); Gregory, G.G.; Hestdalen, C.; Kiikka, C.D.; Kotmel, R.; Richardson, M.C. pp. N30 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses how the incorporation of an optical timing fiducial onto a time-resolved x-ray streak record permits one to precisely relate the x-ray emission to the incident laser pulse. The authors approach to recording fiducials is twofold. In addition to recording the x-ray emission on a bifurated photocathode, they also streak the incident laser light at 351 nm which is scattered from the target and an independent signal at $4\omega_0$ (264 nm) which is derived by frequency quadrupling a tiny fraction of the OMEGA laser driver output. The signal at $4\omega_0$ is transported through the vacuum wall to the streak camera photocathode via fiber optics. A 200 Å aluminum layer on mica is utilized for the UF sensitive photocathode. Examples and further details of this system are presented.

52402 Green light (2ω) as an x-ray streak camera fiducial. Nilson, D.G. (Lawrence Livermore National Lab., CA (USA)); MacGowan, B.J. pp. N28 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the fiducial system for the multiple optical and x-ray streak cameras on the two Nova target chambers intended to allow cross comparison of time resolved data from laser plasmas to an accuracy of ± 50 psec. Development of the system has led to the discovery that Al coated fiber optics incorporated into the x-ray photocathode can be made to produce photoelectrons when irradiated by ~ 1 μJ of 2 ω light. The low loss and dispersion of 2 ω light in fused silica fibers are significant advantages over our original intention of using 3 ω light. Results indicating input and output pulse lengths and required energies to produce photoelectrons are discussed.

52403 Resolution characteristics of Lawrence Livermore National Laboratory soft x-ray streak cameras. Glendinning, S.G. (Lawrence Livermore National Lab., CA (USA)); Medecki, H. pp. N27 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses x-ray streak cameras characterized for spatial resolution and for the line spread function contribution to the temporal resolution. The contrast transfer function of a gold resolution grid of varying spatial frequency was measured for each camera. In addition, the image intensifier tube normally used for LLNL streak cameras was characterized separately. Limiting visual

resolution for the system was found at 10 1p/mm at camera photocathode with a corresponding temporal line spread function of 440μm FWHM. Limiting visual resolution for the intensifier was found at 14 1p/mm at intensifier photocathode. Comparisons to commercial streak camera models are described.

52404 Development of an x-ray framing camera. Stearns, D.G.; Wiednald, J.D.; Cook, W.M.; Hanks, R.L. pp. N26 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses an ultrafast x-ray framing camera being developed to be used as a diagnostic instrument in laser experiments. The framing camera is designed to provide temporal resolution of 50 ps and spatial resolution of 30 microns at the large plane. The unique design incorporates the x-ray photocathode directly into a suspended-strip transmission line. The photocathode is gated using a high-voltage (5 KV) pulse of short duration generated with a photoconductive switch. The photoelectrons are extracted through an unbiased microchannel plate and are directly detected with a CCD in the electron-bombardment mode. The authors report on current progress in the fabrication, characterization and integration of the various components of the instrument.

52405 Asymmetry of Stark-broadened Layman lines from laser-produced plasmas. Joyce, R.F. (Florida State Univ., Tallahassee, FL (USA). Dept. of Physics); Woltz, L.A.; Hooper, C.F. Jr. pp. N20 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses three significant causes of spectral line asymmetry: the ion-quadrupole interaction, the quadratic Stark effect and fine structure splitting that are included in the calculation of Lyman line profiles emitted by highly-ionized hydrogenic radiators in a dense, hot plasma. The line asymmetries are shown to be strongly dependent on the plasma density, indicating that the asymmetry may be of use as a density diagnostic.

52406 Escape factors for Stark-broadened line profiles. Mancini, R.C. (Florida State Univ., Tallahassee, FL (USA). Dept. of Physics); Joyce, R.F.; Hooper, C.F. Jr. pp. N21 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, New York, NY (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses escape factors for upper and lower limits to the source function appropriate for spherical geometry that have been evaluated using a set of Stark-broadened line profiles, computed with different approximations. The method used to compute the escape factors, which is based on a general formalism can be applied to any kind of line profile and is suitable for any geometry. The escape factor is expressed as an integral over the frequency of a functional of the line profile; hence our treatment highlights its dependence on the line profile. Comparisons are made with previous calculations that used Holtsmarkian line profiles and significant differences are noted.

52407 Absorption spectroscopy of a laser produced plasma. Kilkenny, J.D. (Lawrence Livermore National Lab., CA (USA)); Lee, R.W.; Kolbe, G.; Estabrook, K.; Landen, O.; Bailey, J. pp. N22 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses how pin plasma sources are used as x-ray backlights for an Al plasma produced by focusing 1.06 μm laser light to irradiances of 10^{12} W/cm^{-2}. Spatially resolved absorption features of the helium like states of ionization of the plasma allow ground state densities of the helium and hydrogen like stages to be measured. Comparison with simulations indicates the need for a realistic opacity effects to produce a high enough state of ionization for the plasma temperature.

52408 Effective γ x-ray excitation rates for plasma impurity measurements. Hill, K.W. (Princeton Univ., NJ (USA)); Bitter, M.; Von Goeler, S.; Hiroe, S.; Hulse, R.; Ramsey, A.T.; Sesnic, S.; Shimada, M.; Stratton, B.C. pp. N8 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses metal impurity concentrations measured by the pulse-height-analyzer diagnostic from Kα x-ray peak intensities by use of an averaged excitation rate $\langle\sigma v\rangle$. Low-z impurity concentrations are inferred from the continuum enhancement due to metals. Since the PHA does not resolve lines from different charge states, $\langle\sigma v\rangle$ is a weighted sum of rates; coronal equilibrium is usually assumed. Improved values of $\langle\sigma v\rangle$ using recent calculations for H-, He-, and Li-like Fe are 45% larger than the earlier rates and yield metal concentrations in better agreement with those from VUV spectroscopy. The effect of charge exchange with neutral hydrogen on coronal equilibrium and $\langle\sigma v\rangle$ is considered.

52409 Observations of centrally peaked impurity profiles in the Alcator-C tokamak following pellet injection. Petrasso, R.D. (Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center); Hopf, J.E.; Wenzel, K.W.; Sigmar, D.J.; Greenwald, M.; Terry, J.L. pp. N10 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses differently filtered x-ray arrays that have been used to instantaneously measure central carbon and molybdenum profiles, Alcator's dominant light and heavy impurities, following pellet injection. The width of the carbon profile is close to the neoclassical prediction of a source-free equilibrium state. The experimental molybdenum profile, which is more uncertain, is between a factor of 1.3 and 3.0 that of the asymptotic prediction of neoclassical theory. Carbon, the dominant non-hydrogenic contributor to Z_{eff}, is found to dramatically affect sawtooth dynamics by altering the central resistivity. Details of the instrumentation, as well as the plasma conditions needed to make such measurements, are described.

52410 Neutral hydrogen density and electron temperature measurements from Rydberg series of He-and H-like argon in the Alcator C tokamak. Rice, J.E. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Marmar, E.S.; Kallne, E.; Kallne, J. pp. N9 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the complete Rydberg series (1snp-1s^2 with $3 \leq n \leq 40$) of He-like argon (Ar^{16+}) has been observed with a compact, high resolution x-ray spectrometer at the Alcator C tokamak. Radial brightness profiles of the lines in the series have been obtained. In the plasma canter, the upper levels are populated by collisional excitation; in the outer regions, radiative recombination is the dominant population process for most of the lines. For the 1s9p- and 1s10p-1s^2 transitions at the plasma edge, charge transfer recombination between intrinsic neutral hydrogen and H-like Ar is the most important population mechanism. From known charge exchange cross-sections, the H_0 density profile can be obtained. Deduced profiles are in good agreement with those calculated from a neutral transport code. Line ratios of certain transitions in H- and He-like Ar are quite sensitive to the electron temperature. Time histories of T_e have been determined under a wide range of operating conditions.

52411 Spectra from a cooling/warming blackbody. Zahrt, J.D. (Los Alamos National Lab., NM (USA)); Shirk, D.G. pp. K14 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical

conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the investigation of the effects of thermal transients on the recorded spectrum of a blackbody source. The authors assumed that the response time of the detector is long compared to the time rate of change of the blackbody temperature. While the source is cooling/warming, it always emits as a blackbody at the instantaneous temperature. Several temperature-time models have been studied. The results are expressed in terms of the exponential integral and other related functions. In particular, for a source starting at temperature Θ and cooling linearly, the spectra is narrower (FWHM) and shifted to lower energy than a blackbody spectrum at temperature Θ. The results of this experiment show that it is possible to generate a non-Planckian shaped spectrum from a thermally evolving Planckian source.

52412 Initial comparison of TFTR neutral species measurements. Kugel, H.W. (Princeton Univ., NJ (USA)); Eubank, H.P.; Gammel, G.; Grisham, L.R.; Kaita, R.; Kamperschroer, J.H.; Kozub, T.A.; Medley, S.S.; O'Connor, T.; Prichard, B.; Langley, R. pp. K3 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract AC02-76CH03073. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses accurate measurements of neutral beam species fractions used for maximizing the neutral beam full energy component and for detail analysis of beam heated reactor grade plasmas. TFTR hydrogen and deuterium neutral beam species were measured using five complementary techniques. Optical Multichannel Analysis and D-D Reaction Analysis measurements were performed in the beamline neutralization region near the ion source. Optical multichannel Analysis, Charge Exchange Analysis. Rutherford Backscatter Analysis, and Neutral Beam Implantation/SIMS were used to study the output neutral beam. Initial results were obtained for four short pulse ion sources with different mechanical, gas feed, and electrical configurations. In general, the preliminary measurements are in agreement for similar operating conditions, but significant relative variations in species yields were observed for some ion source configurations and operating conditions. In addition, preliminary, species radial profile, species angular divergence, species kinetic energy spread, and beam impurity results were obtained.

52413 Neutral beam interlock system on TFTR using infrared pyrometry. Medley, S.S. (Princeton Univ., NJ (USA)); Kugel, H.W.; Kozub, T.A.; Lowrance, J.L.; Mastrocola, V.; Renda, G.; Young, K.M. pp. K2 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discuss how although the region of the TFTR vacuum vessel wall which is susceptible to damage by neutral beam strike is armored with a mosaic of TiC clad POCO graphite tiles, at power deposition levels above 2.5 kW/cm^2 the armor surface temperature exceeds 1200°C within 250 ms and itself becomes susceptible to damage. In order to protect the wall armor, a neutral beam interlock system based on infrared pyrometry measurement of the armor surface temperature was installed on TFTR. For each beamline, a three-fiber optic telescope views three areas of ~30 cm diameter centered on the armor hot spots for the three the ion sources. Each signal is fiber-optic coupled to a remote 1-μ pyrometer which feeds analog signals to the neutral beam interrupt circuits. The pyrometer interlock system is designed to interrupt each of the twelve ion sources independently within 10 ms of the temperature exceeding a threshold settable in the range of 500-1800C. A description of the pyrometer interlock system and its performance is presented.

52414 Vertical high resolution Bragg x-ray spectrometer for the Tokamak fusion test reactor. Bitter, M.; Hill, K.W.; von Goeler, S.; Johnson, L.C.; Raftopoulos, S.; Reale, M.; Schechtman, N.; Sesnic, S.; Spinos, F.; Pinter, G. pp. N6 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 12 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses a Bragg x-ray spectrometer of high spectral resolution which accommodates three crystals and position sensitive detectors in the Johnann configuration and installed in the Tokamak Fusion Test Reactor (TFTR) diagnostic basement for the measurement of radial ion temperature profiles.

52415 Neutral-beam performance analysis using a CCD camera. Hill, D.N. (Lawrence Livermore National Lab., CA (USA)); Pincosy, P.A.; Allen, S.L. pp. K4 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses development of a diagnostic technique to measure (independent of the species mix of accelerated ions) the spatial distribution and absolute magnitude of the atomic-deuterium current produced by a natural-beam source. Using an absolutely calibrated CCD (charge-coupled device) video camera, the authors view the natural beam as it passes through a relatively high pressure (10^{-5} Torr) region outside the neutralizer: collisional excitation of the energetic neutrals produces a Dα emission (6561 Å) that is proportional to the local atomic current density. For the energy range of interest (5 keV>E>20 keV), the excitation rate coefficient is nearly constant to obtain the local atomic current regardless of the fraction of full, half, and third energy components. Digital processing of the video signal provides profile and aiming information for beam optimization. Results are compared with those obtained from a Faraday cup and infrared imaging of the beam dump.

52416 Space and time resolving spectrograph for fusion plasma diagnostics. Content, D. (Johns Hopkins Univ., Baltimore, MD (USA)); Wroblewski, D.; Perry, M.; Moos, H.W. pp. J14 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses construction of an EUV (60-350 Å) space and time resolving, grazing incidence spectrograph (STRS). The simultaneous spectral coverage of the instrument ranges from 20 to 60 Å, depending on the wavelength region. The spectral resolution is about 1 Å. The spectral resolution, accomplished by using the pinhole camera effect and the inherent astigmatism of a concave grating in grazing incidence, is about 2 m, with a total field of view of 60 cm at a distance of 2 cm from the plasma. The detector consists of a 75 mm MCP image intensifier optically coupled to three CCD area array detectors. Time resolution of up to 2 ms is achieved with high speed read-out electronics. A PDP 11.73 minicomputer controls the spectrograph and collects and reduces 3.0 MB of data per shot. The complete design of the STRS and the results of initial tests of the detector system, spectrograph, and data handling software are presented.

52417 Time resolved spectra in the 80-330 A wavelength region from PLT tokamak plasmas. Dave, J.H. (Naval Research Lab., Washington, DC (USA)); Feldman, U.; Seely, J.F.; Wouters, A.; Hinnov, E.; Suckewer, S. pp. J16 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses time resolved spectra from the PLT plasma recorded by the 2 meter Schwob-Fraenkel Spectrometer. In order to record the 80-330 Å wavelength range, the multichannel plate was moved several times. Spectra were recorded every 50 ms for the duration of the discharge. The data obtained were corrected so that distortions introduced by the flat rather than curved surface of the multichannel plate were accounted for. Examples of typical PLT spectra were wavelength accuracy of 0.02 Å will be shown. The spectra contain primarily ground state transitions in the ions of C, O, Cr, Fe and Ni. The observed lines are emitted typically from plasmas of 100-2000 eV. Examples of spectra of trace elements injected into the plasma during the discharge will also be shown.

These spectra are the result of subtraction of the signals after and before the injections.

52418 **Operation of multi-channel tangential bolometer on PBX.** Paul, S.F. (Princeton Univ., NJ (USA)); Fonck, R.J.; Schmidt, G.L. pp. K7 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses compact 15-channel bolometer array that views plasma emission tangentially across the mid-plane that has been installed on the PBX tokamak. By comparing these diagnostics, poloidal asymmetries in the emission profile can be determined. The detector array consists of 15 discrete 2 mm diameter thinistors, a sintered metal-oxide, which has a high temperature coefficient. Each active detector is operated in tandem with an identical blind detector in a constant current DC Wheatstone bridge configuration. The variation in bias voltage is amplified and stored on a CAMAC transient recorder. The detectors are sensitive to accumulated heat and software has been written to smooth and differentiate the signals so that instantaneous power can be calculated. The cooling time constants are determined (3.1 seconds) so that the loss of heat from the detector during the course of a shot can be compensated. The detectors were relatively calibrated with a tungsten-halogen filament lamp and were found be vary by ±7%. The irradiance profiles are inverted, and the emissivity is typically in the 0.1 to 0.5 W/cm^3 range.

52419 **Slitless intensified readout gated spectrometer.** Gerassimenlo, M. (Lawrence Livermore National Lab., CA (USA)). pp. J18 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses spectrometer developed to meet the requirements of the x-ray laser effort at LLNL. The instrument takes advantage of the instrinsically small divergence and size of the lasing source by putting it, and the grating and the detector on the Rowland circle. This design obviates the need for a slit but makes the target chamber an intergral part of the spectrometer. Sensitivity is maximized by intercepting the entire laser footprint, by keeping the angle of incidence upon the grating at about 70° to the normal and by single photon detection capability at the detector plane. Signal to background is greatly improved by gating the spectrometer at the sub-nanosecond level using three striplines structures deposited on the microchannel plate detector. The sum of incident and refracted angles is kept constant. By using simple spacers and custom ruled gratings any energy in the 60-200 eV range is accessible. Calibration and performance data are presented.

52420 **Nova experimental facility.** Campbell, E.M. (Lawrence Livermore National Lab., CA (USA)); Hunt, J.T.; Bliss, E.S.; Speck, D.R.; Drake, R.P. pp. L1 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the goals of the Nova laser facility to address critical issues for evaluating the feasibility of inertial confinement fusion, to implode DT to densities exceeding 200 g/cm^3 and pressures greater than 10^{12} atmospheres and to perform a wide range of high energy density plasma physics experiments in the areas of UVX/x-ray lasers, hydrodynamics, and radiation generation and transport. An extremely flexible and sophisticated facility is required to successfully perform such a variety of tasks. The facility has been designed to allow nearly simultaneous, independent experiments to be conducted in both target areas. A number of sophisticated optical, XUV, x-ray, and particle diagnostics measure target areas. An optical fiducial system allows cross-correlation of all of the diagnostic systems to better the 50 psec. An overview of the facility, diagnostics, and data acquisition system is discussed.

52421 **Development of gyrotrons for plasma diagnostics.** Woskoboinikow, P. (Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center). pp. L3 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses achievements in gyrotron technology that have created possibilities for new and improved millimeter and submillimeter-wave plasma diagnostics. This achievements are listed. Diagnostics which could benefit include: scattering diagnostics for the study of localized plasma waves, instabilities and turbulence, density interferometry, Faraday rotation polarimetry, and electron cyclotron emission and absorption heterodyne diagnostics. In particular, new diagnostics such as plasma imaging in three dimensions with many detector (⩾10) microbolometer or heterodyne arrays, and scattering from the ion thermal feature to determine localized ion temperature, magnetic field direction, or D/T fuel ratio may become practical with gyrotron sources. A 70 GHz gyrotron has been used for density fluctuation studies in the WT-2 tokamak at Kyoto. At M.I.T. we are implementing a 1kW, >30 ms pulsed, 137 GHz gyrotron scattering diagnostic on the TARA tandem mirror to study instabilities such as the drift cyclotron loss cone. This diagnostic is installed at the plug where, due to strong electron cyclotron resonance heating generated plasma noise, lower power klystron or EIO sources would not be practical.

52422 **Diagnostic system for measurement of particle balance in TMX-U.** Allen, S.L. (Lawrence Livermore National Lab., CA (USA)); Correll, D.L.; Hill, D.N.; Brown, M.D. pp. K5 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses several diagnostics that measure the particle sources and losses in the TMX-U plasma. An absolutely calibrated high-speed (0.5 ms per frame) filtered (6561 Å) video camera measures the total ionization source as a function of radius. An axial view of the plasma automatically integrates the axial variations within the depth of field of the system. Another camera, viewing the plasma radially, measures the axial source variations near the deuterium fueling source. Axial ion losses are measured by an array of Faraday cups that are equipped with grids for repelling electrons and are mounted at each end of the experiment. Nonequal ion and electron (nonambipolar) radial losses are inferred from net current measurements on an array of grounded plates at each end. Any differences between the measured particle losses and/or azimuthal asymmetries in the particle-loss profiles. Methods of system calibration, along with details of computer data acquisition and processing of this relatively large set of data are presented.

52423 **X-ray diagnostics for magnetic fusion.** Silver, E.H. (Lawrence Livermore National Lab., CA (USA)). pp. M1 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses research efforts in magnetic fusion which strongly depend upon information gained from x-ray observations of the confined plasma. Spectroscopic measurements make it possible to determine observations of the confined plasma. Spectroscopic measurements make it possible to determine plasma temperature, density, electron energy distribution, ionization state, impurity content, and plasma velocity. X-ray imaging provides estimates of the spatial distribution of a few of these parameters, facilities temporal studies of plasma size and shape, and indicates MHD activity. The author focuses on diagnosing tandem mirror plasmas. Detector requirements and limitations, recent instrument development and performance, and up to date x-ray measurements are discussed.

52424 **Fiber optic current sensor with Heterodyne detection.** Chandler, G.I. (Los Alamos National Lab., NM (USA)); Forman, P.R.; Jahoda, F.C.; Klare, K.A. pp. K13 of Proceedings of the 6th

topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the toroidal plasma current in the ZT-40M experiment (100-380 kA) measured using a fiber optic sensor. This sensor consists of six turns of permanently twisted, single mode fiber which was wound poloidally around the experiment. By modifying the laser output to a rotating linear polarization, amplitude independent single output heterodyne detection is possible. The signal is proportional to the B field produced by the plasma current so integration of the data is not required to obtain the current. Comparison with the existing Rogowski coil consistently shows less than 1% difference. Present efforts are directed toward simplifying the design to minimize optical alignment and to implement real time digital data reduction. The fiber current sensor has demonstrated accuracy comparable with existing techniques. It possesses broad frequency response, it eliminates insulation, electromagnetic interference, and ground loop problems and can easily be installed on existing plasma experiments.

52425 **An atmospheric arc facility to study the non LTE plasma properties of a magnetically rotated electric arc.** Frierson, R.V.; Eddy, T.L.; Putlko, V.F. pp. K16 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper describes a facility for the spectroscopic diagnostics of an electric arc in a rotating magnetic field. The magnetic field is used to convert the arc into a surface of revolution which internally provides a more uniform and controllable plasma for particle treatment or plasma chemistry applications. The magnetic field also enhances the spectral lines indicating a non-LTE condition. The facility resembles a wall stabilized chamber arc of 50 mm dia. having a tubular tungsten cathode (for injection) and a circular anode with a 20 cm gap. A motor stator surrounds the copper wall plates and is wound to provide a two pole rotating magnetic field. It was slotted to view the rotating arc. A high frequency, two phase amplifier and phase shifter are used to generate the rotating magnetic field in the coil. Present operating conditions are: 0-300 Gauss at 500-2000 hz and 100-1000 amps. The measurement of quasisteady and rotating arc temperatures is discussed.

52426 **Soft x-ray and visible imaging systems for measurement of noncircular tokamak plasmas in PHX.** Fonck, R.J. (Princeton Univ., NJ (USA)); Hulse, R.A.; Jaehnig, K.P.; Reusch, M; Roney, P. pp. J20 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

J20.

This paper discusses quantitative analysis of proximity-focused chevron microchannel plate images with the purpose of indirectly deriving information on the central plasma current distribution is presently underway, and two complimentary approaches being developed. The first directly inverts the toroidally projected image to obtain the poloidal emission distribution. The second maps the midplane emissivity distribution onto poloidal flux surfaces which are calculated by an MHD equilibrium code, and the generates a model image for comparison to the measured image. The data acquisition system has also been used to study emissions from the PBX divertor region as imaged through narrow band interference filters to isolate low charge states of H, C, and O.

52427 **An arc facility for investigating non-LTE thermodynamic and transport phenomena in low and high pressure plasmas.** Sedghinisab, A. (Georgia Inst. of Tech., Atlanta, GA (USA)); Eddy, T.L.; Murray, R.T. pp. K15 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses a high pressure arc facility modified for computerized control and data acquisition to simplify measurements of non-LTE plasmas. The non-LTE methods have shown that numerous spectral lines and continuum must be accurately, precisely and quickly measured.The instrumentation uses a 1-m monochrometer with programmed wavelength slews and scans; oplasma scans; and monitoring of chamber pressure, current, voltages, and location. Multiple flows of various gases can be provided simultaneously. Plasma self absorption is determined via a concave back mirror and shutter with final alignment via computer plots. The raw data is corrected for absorption, zeroed, centered and smoothed. The net line intensity is then determined and Abeled prior to feeding into LTE or non-LTE analysis methods. Sample results are presented at 0.1,1 and 10 atm.

52428 **A novel scanning method for tokamak spectroscopy.** Ramsey, A.T. (Princeton Univ., NJ (USA)). pp. J4 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the problem of optical access for spectroscopic diagnostics to all poloidal regions of a plasma in a current generation tokamak which has become severe. Window sizes are limited and plasmas have grown; as a result, one must scan a large angle through a small window in a high (over 5 Tesla) field, often at elevated temperatures. No prudent person wants to put a moving system in such an environment. A system has been designed which uses only a mirror at the window. The rest of the elements (field lenses, a small, easily shielded mirror scanner, and the spectrometer) are several meters away behind a wall. The details of a design for TFTR are presented. All components are catalog items. Scan angles of $\pm 40°$ are achieved, and the scan angle in the plasma is linearly proportional to the ramp voltage applied to the scanner. Access to tokamak is through a 15 cm hole in the floor, and the optics of the spectrometer are filled.

52429 **Some non-LTE diagnostic methods for hydrogen plasmas.** Eddy, T.L. (GA Technologies, Inc., Oak Ridge, TN (USA)); Cho, K.Y. pp. J8 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 Grant CPE-8311325. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper shows that if electric and magnetic fields are not negligible, then the 2-T model assumed by many non-LTE plasma diagnostic techniques may lead to serious errors. Significant difference between T_e and T_{ex} have been shown to exist with electric field strengths as low as ~10 V/cm. Multithermal equilibrium (MTE) calculations show significant deviations in line emission coefficients when $T_e \neq T_{ex}$ compared to equivalent $T_e \neq T_q$. A quasi non-dimentional MTE continuum relation is present to assist in diagnostics. Normalized line emission coefficients verses N_e are used to indicate the type and extent of non-LTE. The MTE state diagram for hydrogen is used to show why non-LTE plasmas often appear to be in LTE based on N_e determinations.

52430 **The study of the detached plasma regime in TFTR using the MIRI far infrared interferometer.** Mansfield, D.K. (Princeton Univ., NJ (USA)); Park, H.K.; Strachan, J.D.; Bush, C.E.; Grek, B.; Johnson, D.W.; Johnson, L.C.; Stauffer, F.J.; Schivell, J. pp. H20 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses how plasmas have been formed in TFTR which separate completely from the limiter and are called detached plasmas. The physical evidence for the separation from the limiter is that all the ohmic input power is radiated away at the plasma boundary which can be 10→30 cm inside the limiter. The 10 chord multichannel MIRI interferometer system has been used to diagnose this region and follows the formation of the detached state through a MARFE. MIRI indicates that a plasma ~0.5→1 x 10^{13}

cm^{-3} occurs in the region between the luminous boundary and the limiter.

52431 Multichordal charge exchange recombination spectroscopy on the D3-D tokamak. Seraydarian, R.P. (GA Technologies, Inc., Oak Ridge, TN (USA)); Burrell, K.H. pp. J2 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses significant improvements in the spectroscopic system to measure ion temperature and plasma rotation speed profiles on D3-D. The number of spatial chords increase from six tangential chords viewing one neutral beam to eight tangential and eight vertical chords viewing separate neutral beams. These views allow measurement of both toroidal and poloidal rotation. Instrumental response improves by coupling the two spectrometers to the tokamak using one, 1.5 mm diameter quartz fiber per chord, thus solving the spectral alignment problem associated with use of three, 600μ fibers per chord. By increasing photon gain through use of a two stage image intensifier, minimum time resolution of 2 ms is possible. Enhanced memory in the data acquisition system allows up to 256 consecutive spectra to be acquired per shot. Unique features of the alignment and calibration procedures are discussed.

52432 CHERS: Charge exchange recombination spectrometer for ion temperature measurement on TFTR. Jaehnig, K.P. (Princeton Univ., NJ (USA)); Fonck, R.J.; Arnold, N.; Lagin, R.; Kindsfather, R.; Schneider, U. pp. J1 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract AC02-76CH03073. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses spatially and spectrally imagining spectrometer system being prepared for installation on TFTR and principally used to provide ion temperature and rotation velocity profiles via charge exchange recombination spectroscopy. High speed (8 MHz) 10-bit digitization and buffering of raw data is described. The entire system is controlled by a dedicated micro-VAXII microcomputer which provides both real-time control of the image processor during a discharge and standard CAMAC-driven control functions. Data normalization, compression, and line fitting is performed with both a high-speed pipeline processor and the micro-VAXII CPU. The generic detector and data acquisition hardware and software have been tested with an equivalent LSI-11/73 driven system on PBX.

52433 Flat response detectors from UV and x-ray region. Kania, D.R. (Los Alamos National Lab., NM (USA)). pp. I2 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper studies millimeter cubes of InP doped with Fe and neutron damaged GaAs for use as detectors in the UV and X-ray region. The results of measurements are reviewed and the limits of the applicability of these detectors are described.

52434 Spectroscopic diagnostics of a copper laser-produced plasma produced by a line focus on a thin target. Lee, T.N. (Naval Research Lab., Washington, DC (USA)); Moland, F.P.; Elton, R.C. pp. J19 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses 500J 2-6 ns Nd-laser focused to a 12 mm x 100 μm line on a thin (400-1500 Å) copper coating, supported by a 1500 Å thick formvar substrate. Space-resolved 8-13 Å x-ray spectroscopy and pinhole photography have been utilized. The main spectral features typically observed include intense neon-like Cu XX lines and somewhat less-intense Cu XIX and XXI lines. Two types of axial structure are observed: one is characterized by a finely (<100 $\mu\pi$ corrugated irregular structure, and the other by a mm-scale non-uniformity. The former could well be due to an early development of a hydrodynamic instability, while the latter appears to be associated with a mismatch between the laser pulse risetime and a characteristic (thickness-dependent) foil vaporization time. The electron temperature of the Cu XX plasma has been estimated from line intensity ratios of the nd-2p ($n \geq 4$) transition lines.

52435 Analysis of highly asymmetric radiation loss profiles in TFTR. Schivell, J. (Princeton Univ., NJ (USA)); Bush, C.E. pp. K9 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract AC02-76CH03073. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the profiles measured in TFTR with two bolometer arrays, one of which looks in at the plasma horizontally and one vertically. Under some conditions the profiles have large, poloidally local features. The most common are marfes and the enhancement from running the plasma on the inner bumper limiter. It turns out that marfe behavior shows up very clearly in the bolometer arrays. The profiles have been analyzed by separating the marfe radiated power from the normal part of the plasma. Marfe location is determined by inspection. It shows an evolution from stationary to moving marfe to detachment from the limiter. Marfe power is a sensitive function of plasma density. For a given level of marfe power the threshold density is a function of q which behaves much like the density limit. For the inner bumper profiles a 2-D reconstruction procedure has been developed, dividing the cross-section into zones which are tailored to the authors' specific geometry.

52436 A system for laser injection of tracer elements into TFTR plasmas. Timberlake, J. (Princeton Univ., NJ (USA)); Cohen, S.; Dereka, N,; Luyer, S. pp. K10 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses a vacuum and manipulator system built for a TFTR experiment which utilizes the laser blow-off technique to inject various elements into TFTR plasmas for diagnostic purposes. Large (17 in) square pyroflat flanges are used for improved access. Internal target positioning is provided by two perpendicular pairs of rotary motion feedthroughs connected to threaded, electropolished stainless steel rods with SP-3 polyimide nuts. This combination has provided low friction properties in-vacuo in off-tokamak tests. The configuration of the target manipulator is such that equal gravitational loading occurs on both the x- and y-drives. The entire system has been subjected to 0°-150°C thermal cycles and suffered no degradation in vacuum or mechanical properties.

52437 Optical and uv/x-ray imaging diagnostics for imploding foil experiments. Lee, P.H.Y. (Los Alamos National Lab., NM (USA)); Price, R.H.; Reay, J.; Pecos, J.; Seagrave, J.; McGurn, J.; Cochrane, B.; Anderson, B. pp. J21 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

In this paper, the authors use a framing camera consisting of 4 gated microchannel plates with adjustable gate and interframe times to record optical or uv/x-ray emission images during the implosion of inductively driven ultra-thin cylindrical foils. Since the flux compression generator and the opening switch are driven by high explosives, the framing camera is located at a distance from the experiment. For optical imaging in the visible region, an f/10, 2800 mm focal length catadioptric telescope is used to image the foil into the microchannel plates. For uv/x-ray imaging, we mount a disposable pinhole camera on the target chamber with a P-Terphenyl-coated screen to convert the uv/x-ray image into the visible region, the same optical imaging procedure is then used. This instrument is well suited for recording a sequence of events where the brightness changes by many orders of magnitude.

52438 Photoconductor x-ray detectors and bolometers. Wang, C.L. (Lawrence Livermore National Lab., CA (USA)); Auerbach, J.M.; Eckels, J.D.; Kornblum, H.N.; Pocha, M.D.; Price, D.F.; Slaughter, D.R.; Smith, J.A.; Kania, D.R.; Wagner, R.S. pp. N25 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper reports tests of InP:Fe, GaAs, GaAs:Cr, and polycrystalline Si, at Nova laser with 1 ns low energy x-rays, at Febetrons with 3 and 30 ns 100 keV x-rays, at Zapp Z-pinch machine with 100 ns low energy x-rays and at the Lawrence Livermore National Laboratory electron linear accelerator with 50 ps 100 MeV γ-rays. The temporal and spectral responses are discussed.

52439 Radial and tangential scanning of the hard x-ray Bremsstrahlung emission from tokamak plasmas. Von Goeler, S. (Princeton Univ., NJ (USA)); Stevens, J.; Bernabei, S.; Bitter, M.; Chu, T.K.; Hill, K.W.; Hooke, W.; Hosea, J.; Hsuan, H.; Jobes, F. pp. NI of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the launching of RF waves in the lower-hybrid and electron-cyclotron range of frequencies which leads often to the formation of energetic non-Maxwellian tails of the electron velocity distribution. The electron velocity distribution is derived from the hard x-ray bremsstrahlung emission. It is measured by radial and tangential arrays of hard x-rays detectors, consisting of 3 in. x 3 in. NaI crystals. The detectors are operated either in the pulse height analysis mode to obtain photon spectra or in the current mode to record time variations with frequencies up to 10 kHz.

52440 Pyroelectric x-ray detectors and x-ray pyrometers. Wang, C.L. (Lawrence Livermore National Lab., CA (USA)); Auerbach, J.M.; Eckels, J.D.; Koo, J.C.; Kornblum, H.N.; Price, D.F.; Smith, J.A.; Stotlar, S.C. pp. N23 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract W-7405-ENG-48. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses pyroelectric detectors which are very promising x-ray detectors for intense pulsed x-ray/γ-ray measurements and can be used as x-ray pyrometers. They are fast, passive, and inherently flat in spectral response for low energy x-rays. The authors report tests of $LiTaO_3$, $Sr_{.5}Ba_{.5}Nb_2O_6$ and $LiNbO_3$ detectors at Nova laser with 1 ns low energy x-rays and at Zapp Z-pinch machine with 100 ns x-rays. The temporal and spectral responses are discussed.

52441 Evaluation of soft x-ray average recombination coefficient and average charge for metallic impurities in beam heated plasmas. Sesnic, S.S. (Princeton Univ., NJ (USA)); Bitter, M.; Hill, K.W.; Hiroe, S.; Hulse, R.; Shimada, M.; Stratton, B.; Von Goeler, S. pp. N7 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses the soft x-ray continuum radiation in TFTR low density neutral beam discharges which can be much lower than its theoretical value obtained by assuming a corona equilibrium. This reduced continuum radiation is caused by an ionization equilibrium shift toward lower states, which strongly changes the value of the average recombination coefficient of metallic impurities γ, but only slightly the average charge Z. The authors demonstrate the parametric dependence of γ and Z for Ti, Cr, Fe, and Ni impurities on neutral density (equivalent to beam power), electron temperature and electron density. These values are obtained by using either a one-dimensional transport code (MIST) or a zero dimensional code with a finite particle confinement time. As an example, we show the variation of γ and Z in different TFTR discharges.

52442 Two-dimensional tokamak density distribution measurements using phase-imaging interferometry. Doyle, E.J. (California Univ., Berkeley, CA (USA)); Howard, J.; Peebles, W.A.; Luhmann, N.C. Jr. pp. H21 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

The authors present two-dimensional tokamak density distribution measurements. These measurements have been made using phase-imaging interferometry.

52443 Toroidal variation of power radiated from TFTR. Bush, C.E. (Oak Ridge National Lab., Oak Ridge, TN (US)); Schevell, J.; Medley, S.S.; Ulrickson, M. pp. K8 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 DOE Contract AC02-76CH03073. (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses bolometers located at a number of toroidal and poloidal positions and used to determine the toroidal distribution of impurity radiation losses from TFTR plasmas. Distributions for both OH and beam heated H^+, D^+ and He^{++} plasmas have been determined.The distributions are highly peaked at the limiter sector for plasmas run on the outer limiter but more symmetric toroidally when run on the inner bumper limiter. Plasmas detached from both inner and outer limiters have distributions which are basically symmetric toridally and poloidally. The widths of toroidally peaked distributions are $\approx$1 sector of the 20 sector torus. Toroidal distribution data along with limiter temperature data allow for a complete accounting of input power for a large number of TFTR discharges. Scalings of the enhanced radiative losses at the limiter with input power, n_e, and I_p have also been determined.

52444 Very high power density subpicosecond laser for x-ray laser development. Suckewer, S. (Princeton Univ., NJ (USA)). pp. 44 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324–: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

A KrF excimer laser system with a pulse duration of 300 fsec and peak power density of $\sim 10^{18}$ W/cm^2 is presented. Use of this system for the excitation and ionization of a laser produced, magnetically confined plasma used in the development of a new x-ray laser is discussed.

52445 Physical processes in femtosecond laser-target interactions. More, R.M. (Lawrence Livermore National Lab., CA (USA)). pp. 67 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324–: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

The authors review nonequilibrium atomic, electrodynamic, and radiative processes in short pulse plasma generation. They identify which are most important and which pose the most interesting questions.

52446 Ultrashort pulse laser heating of solids. Falcone, R.W. (California Univ., Berkeley, CA (USA). Dept. of Physics); Murnare, M.M.; Kepteyn, H.C. pp. 68 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324–: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

Ultrashort pulse lasers have been used to heat solid and near solid density plasmas to several hundred volt electron temperatures. The relevant absorption mechanisms and the behavior of material in these conditions are discussed.

52447 Direct measurement of the duration of subpicosecond soft x-ray pulse. Van Woerkom, L.D. (AT and T Bell Labs., Murray Hill, NJ (USA)); Freeman, R.R.; Davey, S.; Cooke, W.E.; McIlrath, T.J. pp. 83 of High energy density physics with

subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324--: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

The authors have measured, with 100 fsec resolution, the subpicosecond pulse duration of a soft-xray pulse produced from a laser plasma driven by a high intensity, 300 fsec 308 nm laser. The technique employs the cross correlation of a 100 fsec 616 nm laser pulse with the x-ray pulse in high density krypton. The 616 nm laser pulse effectively switches the absorption of the x-rays in the krypton off and on with a resolution exactly equal to its pulse duration.

52448 Comparison of multiphoton and collisional ionization in high intensity laser-plasma interactions. Meyerhofer, D.D. (Rochester Univ., NY (USA). Lab. for Laser Energetics); Augst, S.; Chuang, Y.H.; Delettrez, J.; Richardson, M.C. pp. 46 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324--: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

Recent multiphoton ionization experiments, have shown that the tunneling ionization theories for complex atoms of Ammosov, et al. are valid in the regime where $n^* > 2$ and the Keldysh tunneling parameter, γ, is less than 1. $n^* = Z\,(E_h/E_{ion})^{0.5}$ with E_h the ionization potential of hydrogen, and E_{ion} that of the charge state of interest. $\gamma = (E_{ion}/2\Phi_{pond})^{0.5}$ where Φ_{pond} is the pondermotive potential of the laser. In high intensity laser-plasma and laser-solid interaction, tunneling ionization due to the laser field may become a dominant ionization channel. The authors discuss the laser and plasma characteristics required for multiphoton ionization to become the dominant ionization process and the effects this has on high intensity, laser-plasma and laser-solid interactions.

52449 The dynamics of dense plasmas produced by ultra-short pulse lasers. Umstadter, D. (AT and T Bell Labs., Murray Hill, NJ (USA)); Freeman, R.R.; Milchberg, H.; McIlrath, T. pp. 89 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324--: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

The interaction of an ultra-short pulse high intensity laser with a solid target is of current interest because the resulting plasma is also solid density. Such a plasma might be a bright short pulse continuum x-ray source to pump an x-ray laser or probe transient properties such as phase transitions or biological phenomena. Recent experiments have revealed that these plasmas are good continuum emitters and that the continuum x-ray duration is subpicosecond (streak camera limited). The x-ray pulse width is primarily determined by the rate at which the electrons and the ionization stages cool from the diffusion of heat into the solid and the expansion of material into the vacuum. The authors report the results of a one dimensional fluid code that models the interaction of an ultra-short laser pulse with a solid target of Aluminum. They describe the dynamics of the mass density, pressure, ionization and expansion velocity.

52450 Ultra-high intensity lasers and experiments at Los Alamos. Schappert, G.T. (Los Alamos National Lab., NM (USA)); Casperson, D.E.; Cobble, J.A.; Jones, L.A.; Kylala, G.A.; Lee, P.H.Y.; Nichols, T.D.; Taylor, A.J.; Tallman, C.R. pp. 35 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324--: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

Recent development in excimer laser technology have made it possible to achieve irradiances on target approaching 10^{20} W/cm^2. Oscillators capable of generating subpicosecond pulses and amplifiers capable of amplifying these pulses without significant pulse stretching or optical distortion are now available. Hence ultrashort pulses of modest energies, focused to nearly-diffraction-limited spots a few microns in diameter, result in an irradiance in excess of 10^{19} W/cm^2. Such laser systems typically operate at a repetition rate of several Hz, ideal for experimental programs. This paper reports on two laser facilities, a KrF and a XeCl system, capable of greater than 10^{17} and 10^{19} Watts/cm^2 respectively.

52451 High intensity picosecond pulse interaction experiments. Richardson, M.C. (Rochester Univ., NY (USA). Lab. for Laser Energetics); Chen, H.; Chuang, Y.H.; Delettrez, J.; Epstein, R.; Kessler, T.; Meyerhofer, D.D.; Uchida, S.; Yaakobi, B. pp. 2 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324--: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

The development of intense short pulse ($\lesssim$ 1ps) laser radiation focusable to extremely high intensities makes possible the investigation of many new regimes in atomic, plasma and nuclear physics. This paper reports on a high power Nd:glass laser system based on chirped pulse amplification which is being assembled for a variety of interaction experiments at focused intensities of up to 10^{18} W/cm^2. Plans are underway to generate even higher intensities with a second laser system having an output energy in the 100 J range, which will also be used to study short-wavelength x-ray laser schemes. Initial interaction experiments at intensities of $\lesssim$ 10^{16} W/cm^2 have concentrated on characterizing energy coupling and x-ray generation with a range of plasma and x-ray diagnostics. These are made concurrent with the development of analytical and numerical models of the interaction mechanisms, atomic physics and hydrodynamics involved in these plasmas. Under prevailing focus spot irradiation conditions on planar solid targets of various materials, efficient coupling (<50%) to a short scale-length plasma is observed, with the creation of highly ionized states, as characterized by x-ray and XUV spectroscopy.

52452 An accelerating reference frame for electromagnetic waves in a rapidly growing plasma: Unruh radiation and the dynamic Casimir effect. Yablonovitch, E. (Bellcore, Navesink Research Center, Red Bank, NJ (US)). pp. 7 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324--: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

In 1974, Hawking showed that black holes can evaporate by the emission of low temperature thermal radiation, now named Hawking radiation. Shortly thereafter, a closely related effect called Unruh radiation became apparent. The author discusses how, according to Unruh and Davies, observers of the electromagnetic field in an accelerating reference frame should see thermal radiation at a temperature T: $KT = h/2\pi\ a/c$ where a is the acceleration relative to an inertial frame, c is the speed of light and h and K are Planck's and Boltzmann's constant respectively. In a frame accelerating at g = 980 cm/sec^2, equivalent to the acceleration experienced at the earth's surface, this thermal radiation is at a temperature of only 4×10^{-20} °K. Therefore, physicists hoping to observe this radiation, have sought out systems being subjected to extreme acceleration.

52453 The interaction of intense laser pulses in plasmas. Prangle, P. (Naval Research Lab., Washington, DC (USA). Plasma Physics Div.); Esarey, E.; Ting, A. pp. 4 of High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17. Optical Society of America, Washington, DC (USA) (1989). pp. 105 (CONF-8909324--: High energy density physics with subpicosecond laser pulses, Snowbird, UT (USA), 11-13 Sep 1989).

The interaction of ultra-high power laser beams with plasmas is rich in a variety of wave-particle phenomena. These phenomena become particularly interesting and involved when the laser power is high enough to cause the electron oscillation velocity to become highly relativistic. Some of the laser-plasma processes discussed include the production of large amplitude plasma waves which could be used to accelerate electrons to ultra-high energies; the possibility of modifying the plasma refractive properties in order to achieve optical guiding of a laser pulse, thus preventing the laser pulse from diffracting; and the possibility of producing coherent radiation at harmonics of the incident laser frequency.

52454 Ion temperature profile measurements using the far line wings of H_α. Bengtson, R.D. (Texas Univ., Austin, TX (USA)); Boedo, J.; Rowan, W.L. pp. 57 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper presents ion temperature profiles for the outer half of the TEXT plasma using the Doppler broadened far line wings of the H_α line profile. The technique depends on the assumption that the hydrogen neutrals have equilibrated with the ions through charge exchange collisions. Data reduction depends upon going far enough out on the line wing that the intensity profile is characteristic of the hottest portion of the plasma along the line of sight, thus removing the need for an inversion procedure. A Fabry-Perot interferometer is used to measure the line profiles because of its superior instrumental profile. This technique is compared with the charge exchange technique and Doppler broadening of impurities. The application to ion temperature measurements using a diagnostic neutral beam is also discussed.

52455 High-resolution Fourier transform spectroscopy: Line widths and line shapes of spectral lines emitted from helium and mixed-gas inductively coupled plasmas. Montaser, A. (Dept. of Chemistry, George Washington Univ., Washington, DC (US)); Ishii, I. pp. 509 of Proceedings of the 7th international conference on Fourier transform spectroscopy: Volume 1145. Cameron, D.G. Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1989). pp. 642 (CONF-890674–: 7. international conference on Fourier transform spectroscopy, Fairfax, VA (USA), 19-23 Jun 1989).

Previous studies of line widths and shapes of spectral lines emitted from the inductively coupled plasmas (ICP) have concentrated on plasmas sustained in pure argon. For the present study, the authors used the Los Alamos Fourier transform spectrometer to estimate line widths and line shapes of Fe I lines emitted from helium and argon-nitrogen ICP discharges. The effect of gas composition and plasma operating conditions on widths and shapes of the spectral lines are examined. Line widths and line shapes of Fe lines are compared with those of argon and helium for Ar ICP and He ICP discharges. Results are used to calculate Doppler temperatures and electron numbers densities of the cited plasmas.

52456 Hot and cold fusion. *Compressed Air (USA),* 95(8): 18-25 (Aug 1990).

This article presents an overview of research in cold fusion research and development in cold fusion at the Tokomak Fusion Test Reactor at the Princeton Plasma Physics Lab, and at the inertial containment facility at Lawrence Livermore National Lab. is described.

52457 A review of recent results with Electron Cyclotron Heating in tokamaks. Prater, R. (General Atomics, San Diego, CA (USA)). *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 22-31 (1 Jul 1989). DOE Contract AC03-89ER51114. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Many experiments using Electron Cyclotron Heating (ECH) of plasmas in tokamaks have been reported over the past two years. At a power level of 4 MW, ECH has achieved electron temperatures as high as 10 keV in the T-10 tokamak, and the H-mode has been attained in divertor discharges in DIII-D and JFT-2M. Regarding global energy confinement in either L-mode or H-mode, ECH appearch to be quite similar in efficiency to neutral injection, but in addition to bulk heating it has been useful for many purposes, including study of local electron heat diffusivity through pulses modulated heating; suppression of sawteeth, Edge Localized Modes, and other MHD activity; suppression of disruptions; preionization and startup; and current drive. In this paper, progress in these areas which has been reported since the IAEA meeting in 1986 will be summarized.

52458 Preparation for propagation and absorption experiments in MTX. Byers, J.A. (Lawrence Livermore National Laboratory, Livermore, California 94550 (USA)); Cohen, R.H.; Fenstermacher, M.E.; Hooper, E.B.; Meassick, S.; Rognlien, T.D.; Smith, G.R.; Stallard, B.W. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 36-39 (1 Jul 1989). DOE Contract W-7405-ENG-48. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Preparatory calculations of microwave transmission through the MTX access duct, propagation of the waves through the plasma and the resulting power deposition profile on a calorimeter located on the tokamak inside wall have been performed. The microwave transmission calculations include the relative phase slippage of waveguide modes in the duct to determine the spatial structure of the wavefront at the duct exit. Ray-tracing calculations show substantial spreading of the beam in the poloidal direction at densities above 1.5×10^{20} m^{-3}, well within the range of the experiments. Initial experiments with low or high toroidal field (cyclotron resonance outside the plasma) will investigate both diffraction and refraction effects, without absorption. Estimates of the fractional absorption of the beam in the initial experiments with the cyclotron resonance at the plasma axis have also been made.

52459 Electron cyclotron current drive by radial transport of particles in a tokamak. Park, S. (Tokamak Fusion Laboratory, University of California, Los Angeles, CA (USA)); Taylor, R.J. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 64-67 (1 Jul 1989). DOE Contract FG03-86ER53225. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Plasma currents have been generated by injecting microwaves at the electron cyclotron resonance frequencies to the Continuous Current Tokamak in the absence of any other power input. The radial profiles of plasma current and particle densities show that the current is driven by the radial flow of electrons acted upon by the self-consistent vertical magnetic fields in a way a dynamo acts. Also the energy spectrum of the current carrying electrons shows that the current is carried by the bulk of the plasma electrons and no superthermal electron contribution was detected.

52460 Electron cyclotron assisted startup and heating scenarios in the compact ignition tokamak. Porkolab, M. (Plasma Fusion Center, MIT, Cambridge, MA (USA)); Bonoli, P.T.; Englade, R.; Myer, R.C.; Smith, G.R.; Kritz, A.H. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 68-71 (1 Jul 1989). (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Electron Cyclotron Radio Frequency heating of the Compact Ignition Tokamak to ignition utilizing a constant source frequency is proposed. The importance of varying the anomalous conductivity ratio is examined for high density discharges with parabolic density profiles. It is concluded that low to moderate values of the anomalous conductivity ratio are desirable for ignition at reasonable RF and alpha powers, with confinement times of the order of 0.6 sec. (AIP)

52461 Optimum launching of electron-cyclotron power for localized current drive in a hot tokamak. Smith, G.R. (Lawrence Livermore National Laboratory, University of California, Livermore, CA (USA)). *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 80-83 (1 Jul 1989). DOE Contract W-7405-ENG-48. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Optimum launch parameters are determined for localized electron-cyclotron current drive near the magnetic axis and the q=2 surface by solving several minimization problems. For central current drive, equatorial and bottom launch are compared. Localized current drive near q=2 is studied for equatorial launch and for an alternative outside launch geometry that may be better for suppressing tearing modes and controlling disruptions.

52462 ECH on the MTX. Stallard, B. (Lawrence Livermore National Laboratory, Livermore, CA (USA)); Byers, J.; Hooper, B.; Meassick, S.; Rice, B.; Rognlien, T.; Verboncoeur, J.; Makowski, M.A. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 84-87 (1 Jul 1989). DOE Contract W-7405-ENG-48. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

The Microwave Tokamak Experiment (MTX) at LLNL is investigating the heating of high density Tokamak plasmas using an intense pulse FEL. Our first experiments, now beginning, will study the absorption and plasma heating of single FEL pulses (20 ns pulse length and peak power up to 2 GW) at a frequency of 140 GHz. A later phase of experiments also at 140 GHz (FY 90) will study FEL heating at 5 kHz rate for a pulse train up to 50 pulses (35 ns pulse length and peak power up to 4 GW). Future operations are planned at 250 GHz with an average power of 2 MW for a pulse train of 0.5 s. The microwave output of the FEL is transported quasi-optically to the tokamak through a window-less, evacuated pipe of 20 in diameter, using a six mirror system. Computational modelling of the non-linear absorption for the MTX geometry predicts single-pass absorption of 40% at a density and temperature of 1.8×10^{20} m^{-3} and 1 keV, respectively. To measure plasma microwave absorption and backscatter, diagnostics are available to measure forward and reflected power (parallel wire grid beam-splitter and mirror directional couplers) and power transmitted through the plasma (segmented calorimeter and waveguide detector). Other fast diagnostics include ECE, Thompson scattering, soft x-rays, and fast magnetic probes.

52463 Particle transport during ERCH on the TEXT tokamak. Richards, B. (Fusion Research Center, University of Texas, Austin, TX (USA)); Gentle, K.W.; Sing, D.C.; Phillips, P.E.; Rowan, W.L.; Wootton, A.J.; Brower, D.L.; Luhmann, N.C.; Peebles, W.A.; Cima, G. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 72-75 (1 Jul 1989). DOE Contract FG05-88ER53267 ;FG03-86ER53225. (CONF-8905120--: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Particle transport coefficients during TEXT discharge have been determined using a modulated-gas feed technique. Comparisons made before and during electron cyclotron heating experiments have shown that the largest effect on transport is an increase in particle diffusion at the periphery of the plasma.

52464 Modeling of LH current drive in self-consistent elongated tokamak equilibria. Blackfield, D.T. (Lawrence Livermore National Laboratory, Livermore, CA (USA)); Devoto, R.S.; Fenstermacher, M.E.; Bonoli, P.T.; Porkolab, M.; Yugo, J. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 114-117 (1 Jul 1989). DOE Contract W-7405-ENG-48. (CONF-8905120--: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

A LH simulation code has been used to simulate elongated plasmas with numerically generated equilibra. The model includes ray tracing using a dispersion relation with electromagnetic and thermal effects and the solution of a 1D Fokker-Planck equation with quasi-linear diffusion on each radial surface. Results are presented for a study of LH drive in ITER. (AIP)

52465 Achievement of second stability by means of lower hybrid current drive. Bonoli, P.T. (Plasma Fusion Center, MIT, Cambridge, MA (USA)); Porkolab, M.; Blackfield, D.T.; Devoto, R.S.; Fenstermacher, M.E. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 118-121 (1 Jul 1989). (CONF-8905120--: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

It is shown that profiles of the safety factor, necessary to access a high beta operating regime in shaped, low aspect ratio tokamaks, can be achieved via off-axis lower hybrid current drive (LHCD). In order to accurately access this RF current generation, a simulation model for LHCD has been extended to noncircular equilibria and combined with an MHD equilibrium solver. Model results will be presented for Versator Upgrade parameters.

52466 Pulsed lower-hybrid wave penetration in reactor plasmas. Cohen, R.H. (Lawrence Livermore National Laboratory, Livermore, CA (USA)); Bonoli, P.T.; Porkolab, M.; Rognlien, T.D. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 126-129 (1 Jul 1989). DOE Contract W-7405-ENG-48. (CONF-8905120--: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Providing lower-hybrid power in short, intense (GW) pulses allows enhanced wave penetration in reactor-grade plasmas. We examine nonlinear absorption, ray propagation, and parametric instability of the intense pulses. We find that simultaneously achieving good penetration while avoiding parametric instabilities is possible, but imposes restrictions on the peak power density, pulse duration, and/or r.f. spot shape. In particular, power launched in narrow strips, elongated along the field direction, is desired.

52467 Wave propagation in a tokamak at lower hybrid frequencies. Stevens, D.C. (Courant Institute of Mathematial Sciences New York University, New York, NY (USA)); Weitzer, H. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 178-181 (1 Jul 1989). DOE Contract FG02-86ER53223. (CONF-8905120--: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Maxwell's equations with the cold plasma dielectric tensor are solved to study wave prpagation and absorption in a tokamak at lower hybrid frequencies. A resonance other than conventional lower hybrid resonance is exhibited and is shown to be extremely sharp. Numerical limitations of this technique are discussed.

52468 Multiple-use plasma laboratory for graduate fusion education. Hankins, O.E.; Gilligan, J.G.; Wehring, B.W.; Bourham, M.; Auciello, O.H. *Transactions of the American Nuclear Society (USA),* 59: 106-107 (1989). (CONF-890604--: Annual meeting of the American Nuclear Society, Atlanta, GA (USA), 4-8 Jun 1989).

In a climate of tight fusion research and teaching laboratory budgets, it has become necessary to utilize equipment obtained for research purposes in the teaching program. Likewise, it is desirable to use plasma research equipment from nonfusion projects to support basic understanding of general plasma concepts. Multiple experiments can also be done on a single device. The plasma laboratory that has been developed at North Carolina State University in the last 4 yr incorporates all of the aforementioned ideas to support a 3-credit-hour hands-on laboratory course for graduate students. Incorporating teaching and research into the fusion plasma laboratory maximizes the resources and gives students experience on actual research tools. 2 refs.

52469 Interpretation of momentum confinement in recent JET [Joint European Torus] and TFTR [Tokamak Fusion Test Reactor] experiments. Pautasso, G.; Stacey, W.M. *Transactions of the American Nuclear Society (USA),* 59: 108-109 (1989). (CONF-890604--: Annual meeting of the American Nuclear Society, Atlanta, GA (USA), 4-8 Jun 1989).

Unbalanced neutral beam injection, used to heat tokamak plasmas, causes the plasma to rotate. It is well documented that the observed momentum confinement time cannot be explained by the existing neoclassical theory of perpendicular viscous momentum transfer. Analysis of Impurity Study Experiment-B, Poloidal Divertor Experiment, and Princeton Large Torus PDX, and data based on the more recent gyroviscous theory of momentum confinement, however, showed good agreement between theory and experiment. In this paper, results from recent Joint European Torus (JET) and Tokamak Fusion Test Reactor (TFTR) experiments in which the various plasma parameters were measured with a good degree of accuracy are presented and shown to be in agreement with the prediction of the gyroviscous theory. 6 refs., 2 figs.

52470 Streak cameras capture x-ray laser emissions. Stradling, G.L. (Los Alamos National Lab., NM (USA). Physics Div.). *Laser Focus with Fiberoptic Communications (USA),* 26(5): 215-226 (May 1990).

The soft x-ray streak camera is a versatile tool for exploring the challenging spectrum of x-ray emissions from the UV through the XUV up to tens of kilovolts in x-ray photon energy. When coupled with an appropriate spectrometer or x-ray imaging optic, the streak camera can provide time-resolved spectral or spatial images with a resolution limit of a few picoseconds. The author discusses soft x-ray streak cameras have many applications. In laser-fusion studies, they probe the hot, high-density regions of the fusion implosions and provide information on the compression and re-expansion of the pellet under the intense pressure of the plasma blow-off. These instruments have allowed to probe the supercritical region of laser plasmas to measure the temperature of the target and the energy flow in the laser deposition region with temporal resolution of tens

of picoseconds. They have also been used to explore x-ray laser operation in various experiments.

52471 ICRF coupling on TFTR using the PPL antenna. Greene, G.J. (Princeton Plasma Physics Laboratory Princeton, NJ (USA)); Colestock, P.L.; Hosea, J.C.; Phillips, C.K.; Smithe, D.N.; Stevens, J.E.; Wilson, J.R.; Gardner, W.; Hoffman, D. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 254-258 (1 Jul 1989). DOE Contract AC02-76CH03073. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Coupling of the PPL ICRF antenna to the TFTR plasma is experimentally measured as $R_c=P/I^2$, where P is the net power dissipate and I is the RF current at a point in the resonant loop. The relation of R_c to the equivalent antenna loading resistance is investigated using a transmission line model that includes the antenna structure and the feedthroughs. Coupling has been experimentally characterized for a variety of discharge conditions including H and ^{3}He minority, D and ^{4}He majority plasmas. Effects of antenna phasing, D neutral beam injection, RF power level, plasma density aned position are discussed. Distinct and reproducible eigenmodes in the loading are observed in H-minority, D-majority plasma during the density rise accompanying neutral beam injection. A 1-D wave propagation model has reproduced the general structure of the modes. For 0-π toroidal phasing, the modes arise from radial reflections from both the reonance-absorption layer and the inner wall of the tokamak; for 0–0 phasing, the modes result from toroidal interference.

52472 Comparison between the dielectric-filled rectangular and vacuum folded waveguide as fast-wave launchers in the ICRF. Lam, N.T. (University of Wisconsin, Madison, WI (USA)); Scharer, J.E.; Eldridge, O.C. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 286-289 (1 Jul 1989). DOE Contract FG02-86ER53218. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

In reactor situations, a waveguide may have certain advantages (such as power handling capability and structural rigidity) over loop antennas as fast wave launchers in tokamaks. We carry out a numerical analysis of a dielectric-filled rectangular waveguide, using a formalim that gives the wave reflection coefficient from the plasma (or the equivalent plasma impedance), once the plasma surface admittance tensor and the eigenmodes of the unloaded launcher are known. In the context of a slab model, we obtain the plasma surface admittance tensor by solving the wave differential equations in a cold plasma, assuming a radiation condition from inside the plasma. The eigenfunctions of the rectangular waveguide are readily written down. For the vacuum folded waveguide, semi-analytical expressions for the TE mode eigenfunctions hasve been obtained by a Ritz variational method. Some problems concerning the calculation of the reflection coefficient for a folded waveguide are discussed.

52473 60 MHz fast wave current drive experiment for DIII-D. Mayberry, M.J. (General Atomics, San Diego, CA (USA)); Chiu, S.C.; Porkolab, M.; Chan, V.; Freeman, R.; Harvey, R.; Pinsker, R. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 298-301 (1 Jul 1989). DOE Contract AC03-89ER52153. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

The DIII-D facility provides an opportunity to test fast wave current drive appoach. Efficient FWCD is achieved by direct electron absorption due to Landa damping and transit time magnetic pumping. To avoid competing damping mechamisms we seek to maximize the single-pass asorption of the fast waves by electrons. (AIP)

52474 Theoretical studies of ICRH in stellaratores and tokamaks. Moroz, P.E. (MIT Plasma Fusion Center, Cambridge, MA (USA)). *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 302-305 (1 Jul 1989). (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

All stellarators can be divided into two classes depending on the parameters ζ_s, which can be easily expressed through the main parameters of stellarator. Features of cyclotron absorption and mode conversion during fast wave ICR plasmas heating are considered. The enhancement due to effect of non-zero $(\mathbf{B}\cdot\nabla)\mathbf{B}$ in the regime of majority fundamental cyclotron resonance is discussed.

52475 Ion Bernstein wave heating experiments on PBX-M. Ono, M. (PPPL, Princeton University, Princeton, NJ (USA)); Greene, G.J.; Bernabei, S. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 306-309 (1 Jul 1989). DOE Contract AC02-76CH03073. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

A multi-megawatt level IBWH experiment on PBX-M[1] is in preparation. The goal of the expriment is to contribute to the attainment of the high beta, second regime of stability. The high power IBWH will be used as an additional heating power source to supplement the existing 6 MW of NBI power to achieve higher β values in PBX-M. Bulk ion heating via IBW excitation with localized, off-axis deposition can be used to modify the pressure profile for improved plasma stability at high β. The high power off-axis heating in principle can generate a significant boostrap current [2]($\approx$30%) in the outer region of the PBX-M plasma complementing LHCD for broadening the current profiles. It is also interesting to note that the available rf power ($\approx$4 MW) is comparable to the predicted power levels required for the rf ponderomotive stabilization of pressure driven modes (such as the high-n ballooning[3] and external kink modes[4]) for the closely fitted stabilizing shell configuration of PBX-M. There are, however, several experimental factors that require careful consideration in planning a high power experiment. Four important factors are discussed here in some detail: 1. Antenna location. 2. Effects of parallel electric fields. 3. Modification of launched wave spectrum due to antenna misalignement 4. Possible interference of wave launching by protective limiters.

52476 ICRF Faraday shield plasma sheath physics: the Perkins paradigm. Wealton, J.H. (Oak Ridge National Laboratory, Oak Ridge, TN (USA)); Ryan, P.M.; Raridon, R.J. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 366-369 (1 Jul 1989). DOE Contract AC05-84OR21400. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Using a 2-D nonlinear formulation which considers the plasma edge near a Faraday shield in a self consistent manner, progress is indicated in the modeling of the ion motion for a Perkins embodiment. Ambiguities in the formulation are also indicated, the resolution of which will provide significant insight into the impurities generation for ICRH antennas.

52477 Analytic theory of ICRF minority heating. Ye, H. (Physics Department, University of California, Berkeley, CA (USA)); Kaufman, A.N. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 374-377 (1 Jul 1989). DOE Contract AC03-76SF00098. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

We present a one-dimensional analytic theory of the ICRF gyroresonant absorption and mode-conversion, for the problem of minority fundamental resonance. Using the wave phase-space method, and the theory of linear mode conversion therein, we obtain explicit expressions for the coeficients of transmission (*T*), reflection (*R*), conversion (*C*), absorption (*A*).

52478 A fast-wave current drive system design for ITER. Yugo, J.J. (Fusion Engineering Design Center, Oak Ridge, TN (USA)); Batchelor, D.B.; Goranson, P.L.; Goulding, R.H.; Jaeger, E.F.; Ryan, P.M. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 378-384 (1 Jul 1989). DOE Contract AC05-84OR21400. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

The development of an efficient current drive system is an essential factor in a steady-state tokamak reactor. For the International Thermonuclear Experimental Reactor (ITER) one of the current drive systems being considered is fast wave current drive (FWCD) in the ion cyclotron range of frequencies (ICRF), supplemented by lower hybrid current drive (LHCD) in the low density edge plasma, although LHD can also be utilized for current ramp-up. Three of the candidate current drive systems (neutral beams,

electron cyclotron and ion cyclotron fast wave) presently have deficiencies either in the technology of sources and transmission systems or in the experimental physics basis. Engineering design and integration of each system will contribute to the basis on which the eventual system choice can be made. This FWCD system design begins to define and address the issues related to implementing such a system on a steady-state tokamak reactor. Plasma modeling by Batchelor, Carter, and Jaeger[1] at ORNL with the two-dimensional, full-wave code ORION[1] provides the basis on which this system has been designed.

52479 RF power applications for ITER. Ehst, D.A. (Argonne National Laboratory, Argonne, IL (USA)). *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 393-401 (1 Jul 1989). (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Current drive and heating in the steady state phase of the International Thermonuclear Experimental Reactor are discussed. Roles of various RF technologies for current drive and heating are compared. Low cost equipment, flexible to provide multiple applications appears highly desirable. (AIP)

52480 Determination of fields near an ICRH antenna using a 3D magnetostatic laplace formulation. Ryan, P.M. (Oak Ridge National Laboratory, Oak Ridge, TN (USA)); Rothe, K.E.; Wheaton, J.H.; Swain, D.W. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 322-325 (1 Jul 1989). DOE Contract AC05-84OR21400. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

In the vicinity of an ICRH antenna strap, where there are no volume currents and a free-space wavelength is much longer than the dimensions of interest, Ampere's law reduces to a curl-free condition on the magnetic field, allowing a magnetic scalar potential to be defined. This scalar potential is a solution of the three-dimensional (3D) Laplace equation and satisfies the following boundary conditions on the magnetic field: (1) the line integral of the mgnetic field around the current strap is equal to the current flowing the strap and (2) the perpendicular component of the magnetic field vanishes at conductor surfaces (no flux penetrasion of perfect conductors). This formulation allows for the magnetic field solution of quite complex 3D geometries, such as poloidal current straps with asymmetric radial feeds or detailed Faraday shield geometries.

52481 Peaked density profiles in circular-limiter *H* modes on the TFTR tokamak. Bush, C.E.; Goldston, R.J.; Scott, S.D.; Fredrickson, E.D.; McGuire, K.; Schivell, J.; Taylor, G.; Barnes, C.W.; Bell, M.G.; Boivin, R.L.; Bretz, N.; Budny, R.V.; Cavallo, A.; Efthimion, P.C.; Grek, B.; Hawryluk, R.; Hill, K.; Hulse, R.A.; Janos, A.; Johns *Physical Review Letters (USA),* 65(4): 424-427 (23 Jul 1990). DOE Contract AC02-76CH03073.

Circular-limiter *H* modes are obtained on the TFTR tokamak during high-power neutral-beam heating. The transition is usually from the supershot to the *H* mode rather than the usual *L* to *H* transition, and thus is obtained in a low-recycling environment with core fueling mainly from the heating beams. As a result, the density and pressure profiles are highly peaked at the center. The global confinement time τ_E is enhanced over *L*-mode scaling by up to $\approx$2.5 times. The onset of edge-localized MHD modes shortly after the *H*-mode transition appears to limit τ_E. Limiter *H* modes of up to 1.5 s duration have been realized.

52482 Investigation of ion-acoustic-decay-instability thresholds in laser-plasma interactions. Mizuno, K. (Plasma Physics Research Institute, University of California, Lawrence Livermore National Laboratory, Livermore, CA (USA)); Young, P.E.; Seka, W.; Bahr, R.; De Groot, J.S.; Drake, R.P.; Estabrook, K.G. *Physical Review Letters (USA),* 65(4): 428-431 (23 Jul 1990).

The ion acoustic decay instability has been studied by monitoring the Stokes sideband of the second-harmonic emission from a laser-produced plasma. The intensity threshold decreased as the laser spot size increased. It reached homogeneous-plasma collisional values in planar plasmas produced using large laser spot sizes ($D \gtrsim 600$ μm), for laser wavelengths of either 1.06 or 0.53 μm. These observations show that the ion acoustic decay instability may well play a more important role in laser fusion that had been generally believed.

52483 Plasma tomography using transient synchrotron radiation. Fisch, N.J. (Plasma Physics Laboratory, Princeton University, Princeton, NJ (USA)); Kritz, A.H. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 414-417 (1 Jul 1989). DOE Contract AC02-76CH03073 ;FG02-84ER53187. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

We show by means of an example in a six-dimensional parameter space that induced transient radiation can inform on the dc electric field and other tokamak parameters.

52484 Analytic expression for mode conversion of electrostatic and electromagnetic waves. Hinkel-Lipsker, D.E. (Dept. of Physics, University of California, Los Angeles, CA (USA)); Fried, B.D.; Morales, G.J. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 422-425 (1 Jul 1989). (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

We have derived analytic expressions, in terms of Airy functions, for the fields and for the reflection and mode conversion coefficients of Langmuir and electromagnetic waves in an inhomogeneous, unmagnetized plasma. Our results, which are valid in the limit of nonrelativistic electron temperature, $T/mc^2 \ll 1$, agree with earlier numerical calculations.

52485 Ponderomotive forces, three-wave coupling, and the bispectrum. Intrator, T. (Dept. Nuclear Engineering & Engineering Physics, University of Wisconsin, Madison, WI (USA)); Meassick, S. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 426-429 (1 Jul 1989). DOE Contract FG02-88ER53264. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

In the Phaedrus-B Tandem Mirror plasma, antennas launch waves with high enough energy density $\delta B^2/8\pi nT \sim 3\times10^{-3}$ that ponderative forces can be significant. These effects are low frequency forces due to spatial gradients of high frequency (RF) wave fields, and have allowed us to experimentally verify the essential physical assumptions and conclusions of the theory and model. The three-wave interaction is composed of applied RF, MHD and parametric coupled sideband waves. The Bispectrum, a Fourier transformed cubic correlation, is used to measure the local magnitude and phase of the three-wave interaction at each point in space, enabling a direct connection between experiment and theory. Wave-wave coupling of the type described by this approach an diagnosable with the Bispectrum may be important in auxiliary ICRF heated tokamaks.

52486 Green's function for RF-driven current in a toroidal plasma. Karney, C.F.F. (Plasma Physics Laboratory, Princeton University, Princeton, NJ (USA)); Fisch, N.J.; Reiman, A.H. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 430-433 (1 Jul 1989). DOE Contract AC02-76CH03073. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

The Green's function for rf-driven currents in a toroidal plasma is calculated in the long mean-free-path limit.

52487 RF induced transport in tokamak plasmas. Kupfer, K. (Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, MA (USA)); Bers, A.; Ram, A. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 434-437 (1 Jul 1989). DOE Contract AC02-78ET51013. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

We investigate the effects of coherent RF wave-fields on the transport of particles in a tokamak by coupling the chaos induced in velocity spacce to particles' radial guiding center drifts. In the following calculation, it is shown that localized, phase coherent structures can induce transport fluxes which are outside the scope of conventional random-phase theories.

52488 Power deposition and field penetration in a field-reversed configuration generated by rotating magnetic fields. Kuthi, A. (University of California, Los Angeles, CA (USA)); Zwi, H.; Wells, B.; Wong, A.Y. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 438-441 (1 Jul 1989). DOE

Contract FG03-86ER53225. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Power deposition profiles derived from measured equilibrium and field-penetration profiles in the RACETRACK rotating magnetic field drived FRC are presented. It is found, that significantly higher RF power can be deposited in the plasma than what is necessary to maintain the diamagnetic current. The Klima relations are reconciled with the higher power input because the excess power is delivered by waves possessing zero net angular momentum. Only the right-hand rotating component of the RF field penetrates fully, and this results in correct circular polarization of the fields on axis regardless of the imposed polarization by the antennas.

52489 **Microinstabilities effect on MHD modes.** Litwin, C. (University of Wisconsin, Madison, WI (USA)). *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 442-445 (1 Jul 1989). DOE Contract FG02-88ER53264. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

The ponderomotive force due to high-frequency microinstabilities can affect the low-frequency macrostability. Two examples of this phenomenon are discussed. It is shown that an α particle loss-cone instability stabilizes the flute mode of an ignited, axisymmetric mirror plasma. In tokamaks, the ion-whistler instability, driven by an anisotropic population of energetic particles, stabilizes the internal kink mode for JET range of parameters.

52490 **RF current drive and helicity injection.** Mett, R.R. (University of Wisconsin-Madison, Madison, WI (USA)); Tataronis, J.A. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 446-449 (1 Jul 1989). DOE Contract FG02-88ER53264. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

Recent studies suggest that low frequency electromagnetic waves possessing helicity may drive currents in plasmas with greater efficiency than schemes based on linear momentum transfer to charged particles.[1,2] A key issue is the transfer of wave helicity into the helicity of the equilibrium magnetic field. Previously we examined the conversion mechanism by following the dynamics of a packet of arbitrarily polarized Alfven waves propagating in an infinite uniformly magnetized plasma.[3,4] Analysis of the equations of magnetohydrodynamics with resistivity and viscosity yielded a set of nonlinear equations governing the Alfven wave amplitude and an induced magnetic field. Solutions for the initial value problem[4] related the induced plasma current to the helicity of the wave and the difference between the magnetic diffusivity and viscosity. In the present investigation we examine solutions for the boundary value problem.

52491 **M=−1 Alfven wave beach heating of two-ion mirror plasmas.** Roberts, D.R. (University of Wisconsin, Madison, WI (USA)); Hershkowitz, N.; Majeski, R.; Edgell, D.H. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 462-465 (1 Jul 1989). DOE Contract FG02-88ER53264. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

RF heating experiments in the central cell of the Phaedrus-B tandem mirror have utilized a rotating field antenna set to excite m=−1 cylindrical eigenmodes for hydrogen cyclotron resonance heating at a magnetic beach. Recent investigations have examined modifications to this heating imposed by the addition of deuterium or helium ion species. In addition to nearly 50% increases in T_i, we have observed evolution of the radial heating profiles with n_M/n_H (M=D or He). In particular, we discuss the correspondence of our observations with the predicted variations with n_m/n_H in the antenna-wave coupling to the slow ion-cyclotron global and fast magnetosonic surface wave eigenmodes.

52492 **Emission of ion and electron cyclotron harmonic radiation from mode conversion layers.** Swanson, D.G. (Department of Physics, Auburn University, AL (USA)); Cho, S. *AIP Conference Proceedings (American Institute of Physics) (USA),* 190(1): 474-477 (1 Jul 1989). DOE Contract FG05-85ER53206. (CONF-8905120–: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

The asymmetry of cyclotron radiation from a mode conversion layer is presented for harmonics of the ion cyclotron frequency and the second harmonic of the electron cyclotron frequency for weakly relativistic electrons. The same form of Kirchhoff's law is found for all cases, relating the emission along each branch to the absorption of an incident wave along the corresponding branch. Results show that the fast wave radiation is more strongly asymmetric at the third harmonic than at the second harmonic of the ion cyclotron frequency, while the slow wave radiation ratio is about same. At the second cyclotron harmonic of weakly relativistic electrons, the asymmetry of radiation is found to be small at high temperature. The effect of equilibrium Bernstein wave radiation is also discussed.

52493 **Turbulent enhancement of particle and heat fluxes during sawtooth oscillations in a tokamak edge plasma.** Rhodes, T.L. (Fusion Research Center, The University of Texas, Austin, TX (USA)); Ritz, C.P.; Lin, H. *Physical Review Letters (USA),* 65(5): 583-586 (30 Jul 1990). DOE Contract FG05-88ER53267.

Using Langmuir probes in the edge plasma of the TEXT tokamak we have identified sawtooth oscillations in density, potential, and temperature. Concurrent with the sawtooth oscillations are increases in the density and potential fluctuation levels which result in significant increases in the fluctuation-driven particle flux and associated heat flux. No changes in the basic turbulence mechanism were observed during the sawtooth passage.

52494 **Halo feedback control of trapped particle instabilities.** Sekiguchi, A. (Columbia Univ., New York, NY (USA). Plasma Physics Lab.); Sen, A.K.; Navratil, G.A. *IEEE Transactions on Plasma Science (Institute of Electrical and Electronics Engineers) (USA),* 18(3): 685-686 (Jun 1990). Grant ECS-86-16322.

This paper reports a collisionless, curvature-driven trapped-particle instability stabilized by a novel remote-stabilization scheme in the Columbia linear machine (CLM). The control signal is applied via a segmented endplate to the halo-plasma region which is cooler and lower in density than the core plasma. The method can be considered as a generic control scheme for the suppression of some instabilities in a variety of plasma devices, including reactor-type machines.

52495 **Transport of long-pulse, high-current electron beams in preformed monatomic plasma channels in the ions focus regime.** Miller, J.D. (Naval Surface Warfare Center, Silver Spring, MD (US)); Gilgenbach, R.M. *IEEE Transactions on Plasma Science (Institute of Electrical and Electronics Engineers) (USA),* 18(3): 658-663 (Jun 1990).

Experiments have been performed demonstrating the efficient transport of long-pulse, high-current electron beams in well-diagnosed, preformed plasma channels. Channels were created by the low-energy electron-beam ionization of low-pressure monatomic gases. These transport efficiencies are comparable to the optimum values obtained for similar pulselengths in previous long-pulse, electron-beam transport experiments in laser-preionized diethylaniline gas. Experimental results show the development of both transverse current centroid oscillations characteristic of the ion hose instability and the microwave emission indicative of relativistic electron beam-plasma electron two-stream instability. Significant microwave emission indicating rapid growth of the two-stream instability has been observed in the *S*-band when the space-charge neutralization fraction f_e exceeds unity.

52496 (CONF-900623–20) **A brief review of cavity swelling and hardening in irradiated copper and copper alloys.** Zinkle, S.J. Oak Ridge National Lab., TN (USA). [1990]. 41p. Sponsored

by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 15. symposium on effects of radiation on materials; Nashville, TN (USA); 17-21 Jun 1990. Order Number DE91000554. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The literature on radiation-induced swelling and hardening in copper and its alloy is reviewed. Void formation does not occur during irradiation of copper unless suitable impurity atoms such as oxygen or helium are present. Void formation occurs for neutron irradiation temperatures of 180 to 550°C, with peak swelling occurring at ~320°C for irradiation at a damage rate of 2×10^{-7} dpa/s. The post-transient swelling rate has been measured to be ~0.5%/dpa at temperatures near 400°C. Dispersion-strengthened copper has been found to be very resistant to void swelling due to the high sink density associated with the dispersion-stabilized dislocation structure. Irradiation of copper at temperatures below 400°C generally causes an increase in strength due to the formation of defect clusters which inhibit dislocation motion. The radiation hardening can be adequately described by Seeger's dispersed barrier model, with a barrier strength for small defect clusters of $\alpha \approx 0.2$. The radiation hardening apparently saturates for fluences greater than $\sim 10^{24}$ n/m^2 during irradiation at room temperature due to a saturation of the defect cluster density. Grain boundaries can modify the hardening behavior by blocking the transmission of dislocation slip bands, leading to a radiation- modified Hall-Petch relation between yield strength and grain size. Radiation-enhanced recrystallization can lead to softening of cold-worked copper alloys at temperatures above 300°C.

52497 (CONF-900623–21) **A theoretical model of accelerated irradiation creep at low temperatures by transient interstitial absorption.** Stoller, R.E.; Grossbeck, M.L.; Mansur, L.K. Oak Ridge National Lab., TN (USA). [1990]. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 15. symposium on effects of radiation on materials; Nashville, TN (USA); 17-21 Jun 1990. Order Number DE91000705. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A theoretical model has been developed using the reaction rate theory of radiation effects to explain experimental results that showed higher than expected values of irradiation creep at low temperatures in the Oak Ridge Research Reactor. The customary assumption that the point defect concentrations are at steady state was not made; rather, the time dependence of the vacancy and interstitial concentrations and the creep rate were explicitly calculated. For temperatures below about 100 to 200°C, the time required for the vacancy concentration to reach steady state exceeds the duration of the experiment. For example, if materials parameters typical of austenitic stainless steel are used, the calculated vacancy transient dose at 100°C is about 100 dpa. At 550°C this transient is over by 10^{-8} dpa. During the time that the vacancy population remains lower than its steady state value, dislocation climb is increased since defects of primarily one type are being absorbed. Using the time-dependent point defect concentrations, the dislocation climb velocity has been calculated as a function of time and a climb-enabled glide creep model had been invoked. The extended transient time for the vacancies leads to high creep rates at low temperatures. In agreement with the experimental observations, a minimum in the temperature dependence of creep is predicted at a temperature between 50 and 350°C. The temperature at which the minimum occurs decreases as the irradiation dose increases. Predicted values of creep at 8 dpa are in good agreement with the results of the ORR-MFE-6J/7J experiment.

52498 (CONF-901116–9) **Potential applications of a new microwave ECR [electron cyclotron resonance] multicusp plasma ion source.** Tsai, C.C. Oak Ridge National Lab., TN (USA). [1990]. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 11. international conference on the application of accelerators in research and industry; Denton, TX (USA); 5-8 Nov 1990. Order Number DE91000707. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A new microwave electron cyclotron resonance (ECR) multicusp plasma ion source using two ECR plasma production regions and multicusp plasma confinement has been developed at Oak Ridge National Laboratory. This source has been operated to produce uniform and dense plasmas over large areas of 300 to 400 cm^2. The plasma source has been operated with continuous argon gas feed and pulsed microwave power. The discharge initiation phenomena and plasma properties have been investigated and studied as functions of discharge parameters. Together with the discharge characteristics observed, a hypothetical discharge mechanism for this plasma source is reported and discussed. Potential applications, including plasma and ion-beam processing for manufacturing advanced microelectronics and for space electric propulsion, are discussed. 7 refs., 6 figs.

52499 (CONF-9002100–, pp. 229-248) **Organization of the ITER [International Thermonuclear Experimental Reactor] Project - Sharing of information and procurements.** Shannon, T.E. (Fusion Engineering Design Center, Oak Ridge, TN (USA)). Oak Ridge National Lab., TN (USA). May 1990. From International Group on Research Reactors conference; Knoxville, TN (USA); 28 Feb - 2 mar 1990. In *IGORR-1: Proceedings of the first meeting of the international group on research reactors.* 262p. Order Number DE90012973. Source: NTIS, PC A12/MF A01.

The International Thermonuclear Experimental Reactor (ITER) project is expected to fully confirm the scientific feasibility and to address the technological feasibility of fusion power. Consequently, the machine must be designed for controlled ignition and extended burn of deuterium-tritium plasma. It must also demonstrate and perform integrated testing of components required to utilize fusion power for practical purposes. Cooperation among four countries/organizations (United States, Soviet Union, Japan, and EURATOM) to build a single experimental reactor will reduce the cost for each country and provide an international pool of scientific and engineering resources. This paper describes ITER organization for conceptual design activity, schedule for conceptual design activities, ITER operating parameters, conceptual project schedule and cost, future plans, basic principles and problems related to task sharing, and basic principles in handling of intellectual property.

52500 (CONF-9009264–1) **Helium effects on the mechanical properties of neutron-irradiated Cr-Mo ferritic steels.** Klueh, R.L. Oak Ridge National Lab., TN (USA). [1990]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Conference on the effect of irradiation on materials of fusion reactors; Leningrad (USSR); 18-20 Sep 1990. Order Number DE91000390. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In the first wall of a fusion rector, large amounts of transmutation helium will be produced simultaneously with the displacement damage caused by high-energy neutrons from the fusion reaction. One method used to simulate irradiation effects for ferritic steels is to add nickel to the steels and irradiate them in a mixed-spectrum reactor. Fast neutrons in the spectrum produce displacement damage, while transmutation helium is produced by a two-step reaction of ^{58}Ni with thermal neutrons. This technique has been used to investigate the effect of helium on tensile properties and toughness. Results from these studies are summarized.

52501 (IAE–4644-8) **High-energy neutron propagation through nonuniformities in a blanket and shields of a thermonuclear reactor.** Zimin, S.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1988. 21p. (In Russian). Order Number DE91602956. Source: NTIS (US Sales Only), PC A03/MF A01; OSTI; INIS.

Calculational results of propagation of high-energy neutrons through channels and slip gaps of a thermonuclear testing reactor (TTR) are presented. Calculations are carried out in two-dimensional plane geometry for a scheme of material composition of the internal blanket and TTR protection with two coaxial and noncoaxial and with curved gaps, direct vacuum channels and channels with water and steel. Neutron fluences with E=14 MeV and E>0.1 MeV during 5MWxyears/m^2 of reactor operation are considered. 9 refs.; 17 figs.

52502 (IAEA-CN–53/F-2-2) **ITER [International Thermonuclear Experimental Reactor]: Nuclear engineering.** Baker, C. Oak Ridge National Lab., TN (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-901025–10: 13. international conference on plasma

physics and controlled nuclear fusion research, Washington, DC (USA), 1-6 Oct 1990). Order Number DE91000713. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

An overview of ITER efforts in the area of nuclear engineering and technology is presented in this paper. It includes technological and design developments for the three major tokamak in-vessel components: blanket, first wall, divertor plates and the tritium fuel cycle. A summary of the on-going R&D is also included. 13 refs.

52503 (JAERI-M–90-086) **Modification of JT-60 NBI system from quasi-perpendicular to tangential injection.** Matsuoka, Mamoru (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Akino, Noboru; Ebisawa, Noboru. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1990. 116p. (In Japanese). Order Number DE91712978. Source: NTIS (US Sales Only), PC A06/MF A01.

Modification of the JT-60 NBI system from quasi-perpendicular to tangential injection is studied. The motivation is that the ripple loss of fast ions would be substantial with the present quasi-perpendicular NBI in the upgraded JT-60 since in the upgrading modification the tokamak vacuum vessel is replaced to a larger bore one while toroidal coils are unchanged and hence toroidal field ripples at the periphery of plasmas increase. How many units of the present seven pairs of upper and lower units should be modified, and then how to combine them to inject beams through limited ports are discussed. The modification is optimized to utilize present beam line components as many as possible but is found to be still a complex task. This is because all present components are specialized to the present large slant angle of ±35.5 degrees. In this report, studies are presented on the necessity and the method of the modification. (author).

52504 (JAERI-M–90-087) **Experimental study of radiation losses on the JT-60 tokamak.** Nishitani, Takeo (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1990. 192p. Order Number DE91712979. Source: NTIS (US Sales Only), PC A09/MF A01.

Bolometric measurement system and associated diagnostics, soft x-ray pulse-height-analyzer, soft x-ray intensity and Balmer α line measurement systems, were developed to investigate the radiation losses of the JT-60 plasmas. The bolometric measurement is the most important diagnostics in the radiation loss study. The soft x-ray pulse-height-analyzer is useful to estimate the metallic impurity concentration, and the soft x-ray intensity and Balmer α line measurements are monitors of radiation in x-ray region and particle recycling in the plasma edge, respectively. In JT-60, the marfe has been observed frequently in high-Ip and high density limited discharges with NB heating after the replacement of the first wall from TiC coated molybdenum tiles to graphite ones. The threshold electron density of the marfe onset increased with the NB power. The empirical scaling of the marfe onset taking account of the NB power was obtained. This scaling was useful to predict the marfe onset condition in NB heated discharges on JT-60. The marfe was modelled based on the radiative thermal instability. The simple model can explain the marfe onset condition. The radiated power from the plasma with marfe was about 90 % of the absorbed power. Both stored energy and central electron temperatures did not change by the marfe onset in spite of the such intense radiation loss. Finally, this study revealed that the most clean plasma was obtained in the metallic first wall with the divertor on JT-60. This fact is suggesting the capability of the metallic material for the first wall of next devices. Enhance radiation localized in the peripheral plasma such as marfe and IDC does not degrade the core plasma confinement or somewhat improves it, so that marfe and IDC are suitable operational regime in the high density region for future devices because they have strong remote-radiative-cooling-effect. (J.P.N.).

52505 (JAERI-M–90-090) **Overview of FER (Fusion Experimental Reactor): FY 1989 report.** Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1990. 102p. (In Japanese). Order Number DE91713025. Source: NTIS (US Sales Only), PC A06/MF A01.

The FER (Fusion Experimental Reactor) project is proposed to construct a next generation tokamak machine in Japan, in order to take a leadership in realizing a fusion reactor under international cooperation. The FER is the machine, which comes in between the present large tokamak machines like the JT-60 and the DEMO reactor for power generation. The mission of the FER is to realize a long controlled burn and to develop and test major fusion component technologies, super conducting magnet and breeding blanket and so on, that is, to demonstrate the engineering feasibility of a fusion reactor. The conceptual design of the FER was started in 1980. In April 1988, a new organization (Fusion Experimental Reactor Team) was constructed to support the ITER activities and also to design the FER. In order to make the FER and the ITER complementary, the FER concept was reconsidered. The FER described in this report is a new version, and the conceptual design will be finished in December, 1990. (author).

52506 (JAERI-M–90-119) **Evaluation tests on first wall and divertor plate materials for JT-60 upgrade.** Yamamoto, Masahiro (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Ando, Toshiro; Takatsu, Hideyuki. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1990. 83p. (In Japanese). Order Number DE91713082. Source: NTIS (US Sales Only), PC A05/MF A01.

This report describes material tests performed to evaluate various grades of isotropic graphite and newly developed carbon/carbon (C/C) composite for application to first wall and divertor plate of JAERI Tokamak-60 Upgrade (JT-60U). Physical and mechanical properties of these materials have been measured by using identical test pieces and testing machines. Based on the obtained data, the evaluation has been made mainly from thermal conductivity, thermal shock and mechanical strength points of view. Limitations on manufacturing size and lead time are also investigated as well as structural applicability to the actual plasma facing tiles. Furthermore, outgassing properties and erosion characteristics against high heat flux are considered in selecting the materials. It is found from these tests that several kinds of 2-D felt type C/C composite have superior thermal conductivity in the range of 300 - 400 W/mK at room temperature, which is considerably higher compared to conventionally used isotropic graphite and C/C composite, and have sufficiently large thermal shock resistance as well. Thermal conductivity of the investigated isotropic graphite has also been improved up to 150 - 180 W/mK at room temperature. Finally, a few grades of 2-D felt type C/C composite with high thermal conductivity have been selected for the divertor plate material. As for the first wall material, two grades of isotropic graphite with higher thermal conductivity have been selected as well as one which has been used successfully in the JT-60 operation. (author).

52507 (JAERI-M–90-123) **Central MHD activities and role of the q=1 rational surface for pellet fuelled JT-60 plasmas.** Kamada, Yutaka (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Ozeki, Takahisa; Azumi, Masafumi; Yoshino, Ryuji; Nagami, Masayuki; Konoshima, Shigeru. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1990. 59p. Order Number DE91713083. Source: NTIS (US Sales Only), PC A04/MF A01.

Improved energy confinement for the pellet fuelled plasmas on JT-60 is mainly due to the peaked density and pressure profiles inside the q=1 rational surface, where the confinement characteristics appear to be better than those in the outer (q>1) region. In the well-center-fuelled pellet injection discharges, the sawtooth activity can be suppressed completely during 0.4≈1 sec or the frequency of sawtooth is reduced by up to one order of magnitude during 0.5≈1.5 sec after the pellet injection. For high high-current low-q (Ip = 2.5≈3.1 MA; q(a) < 3) discharges, reduction in the sawtooth frequency has a strong relationship with enhanced confinement and peakedness of the electron density profile. The contribution of the sawtooth activity to the global energy confinement increases systematically with decreasing q(a). At the sawtooth emerging after the pellet injection into high-Ip limiter discharges, only small amount of the central kinetic energy is released and the sawtooth does not follow the fully reconnecting style. The release of the central kinetic energy and the existence of precursor and successor m = 1 oscillations are discussed. The sawtooth crash tends to have more ideal-like characteristics for higher beta values and lower safety factors. The rotation velocity of the central plasma column after the pellet injection is also discussed with the frequencies of the m = 1 oscillations. Just after the pellet injection, the plasma

column starts to rotate in the ion-diamagnetic direction or the co-direction to the plasma current. At each sawtooth, the rotation frequency changes suddenly to the ion-diamagnetic direction or the co-direction. (author) 47 refs. 44 figs.

52508 (LA–11826-MS) **Target physics results at 248 nm wavelength from the Aurora laser system high-intensity campaign.** Watt, R.G.; Cobble, J.; Gomez, C.; Kephart, J.; Kristal, R.; Turner, T.P.; Oertel, J.; Thomas, S.; Netz, D.; Jones, J. Los Alamos National Lab., NM (USA). Oct 1990. 32p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE91000887. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Au and Si targets have been irradiated using the Aurora KrF laser system, and diagnosed with x-ray and optical diagnostics. The x-ray diagnostics were sensitive to the 0.1–10 keV range. Initial, manually aligned results indicate significant plasma heating and intense x-ray production, with incident peak intensities on target of $1 - 2 \times 10^{14}$ W/cm^2 in a focal spot of order 500 μm diameter. Total energy delivered to the target in 36 of the available 48 target beams was approximately 1200 J in pulses with FWHM in the 3–5 ns range. M-band radiation was observed from Au foil targets. Initial bandwidth measurements on the laser indicate $\approx$20 cm^{-1} without bandwidth enhancement efforts.

52509 (LA-UR–90-2938) **ZTI: An ignition class reversed-field pinch.** Bathke, C.G.; Krakowski, R.A.; Miller, R.L.; Werley, K.A. Los Alamos National Lab., NM (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-900918–9: 16. symposium on fusion technology, London (UK), 3-7 Sep 1990). Order Number DE91000447. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A cost-optimized conceptual design of an intermediate-step, ignition-class RFP device (ZTI)for the study of alpha-particle physics and burn control in a DT plasma is reported. With major and minor plasma radii R_T = 2.4m and τ_p = 0.4m, respectively, and for conservative extrapolations of experimental energy-confinement times, ion-density profiles, and impurity levels, the ZTI operating conditions during a 5-s period of constant fusion power are: toroidal plasma current $I_\phi \simeq 9$ MA, plasma temperature $T \simeq 11$ keV, plasma density $n_i \simeq 3 \times 10^{20}$ m^{-3}, fusion power $P_F \simeq 100$ MW, and physics Q-value $Q_p \simeq 5$ for a total machine size that corresponds to $P_F/M_{FPC} \simeq 590$ kW/tonne. This physics design point was adopted as a "strawman" with which to examine the requirements of ohmic heating to DT ignition and to perform a cost-optimized magnetics design. The ZTI design reflects potentially significant cost savings relative to similar ignition-class tokamaks for device parameters that reside on the path to a viable commercial RFP reactor. The methodology and results of coupling realistic physics, engineering, and cost models through a multi-dimensional optimizer are reported for this device that would follow the 2-4 MA ZTH presently under construction.

52510 (LA-UR–90-2974) **50 kA, 50 kV DC international and switching systems for the Los Alamos ZTH experiment.** Reass, W.A.; Cordova, R.J.; Garcia, J.G. Los Alamos National Lab., NM (USA). [1990]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-900918–8: 16. symposium on fusion technology, London (UK), 3-7 Sep 1990). Order Number DE91000442. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Los Alamos National Laboratory has completed the engineering design and development for the high power electrical switching networks for the ZTH experiment. ZTH is Reversed Field Pinch (RFP) plasma experiment with a 4 MA plasma current capability. Power to the ohmic heating (OH), equilibrium field (EF), and toroidal field (TF) coils will be provided from a 1.43 GVA turbo-alternator, which has over 600 MJ of extractable energy. The DC interrupting switch will handle 2.4 GVA, 150 MJ during initial machine operations. An additional 150 to 200 MJ are required for flat-topping the plasma current. A new ultra-high power switch, designed and tested at Los Alamos, will be used to reconfigure the power supply connections so that the supplies can be switched from parallel to series operation. In this manner, the same supplies can be used to charge and then flat-top the OH coils. The inexpensive cost of these switches results in significant economy of power supplies and systems. Detailed engineering information will be presented for the family of 25 kA and 50 kA, 50kV fast isolation and transfer switches, including testing of special water-cooled units capable of 50,000 amperes continuous duty. Similarly, detailed engineering data will be provided for the 150 MJ, 50 kA, 50kV DC interrupting system. This includes information on I_2t heating losses, contact resistance, long recovery time voltage standoff testing, and other pertinent engineering parameters. 6 refs., 12 figs.

52511 (LA-UR–90-3246) **Continued studies of co-pumping of deuterium and helium on a single, 4K activated charcoal panel.** Walthers, C.R. (Los Alamos National Lab., NM (USA)); Jenkins, E.M.; Batzer, T.H.; Sedgley, D.W.; Konishi, S.; Ohira, S.; Naruse, Y. Los Alamos National Lab., NM (USA). Sep 1990. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-901007–3: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000218. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The short program undertaken in 1989 to evaluate the feasibility of co-pumping deuterium and tritium (DT) and helium on a charcoal sorbent showed that the charcoal will indeed simultaneously pump the gases. Of interest also was the fact that the total accumulation of helium (capacity) was virtually identical in constant throughput runs in which the D_2/He ratio was changed between runs. The test program described in this paper undertaken to evaluate further the co-pumping capabilities of the charcoal sorbent.

52512 (LA-UR–90-3261) **Tritium experiments on components for fusion fuel processing at the Tritium Systems Test Assembly.** Konishi, S. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan)); Yoshida, H.; Naruse, Y.; Carlson, R.V.; Binning, K.E.; Bartlit, J.R.; Anderson, J.L. Los Alamos National Lab., NM (USA). [1990]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-901007–4: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000213. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Under a collaborative agreement between US and Japan, two tritium processing components, a palladium diffuser and a ceramic electrolysis cell have been tested with tritium for application to a Fuel Cleanup System (FCU) for plasma exhaust processing at the Los Alamos National Laboratory. The fundamental characteristics, compatibility with tritium, impurities effects with tritium, and long-term behavior of the components, were studied over a three year period. Based on these studies, an integrated process loop, "JAERI Fuel Cleanup System" equipped with above components was installed at the TSTA for full scale demonstration of the plasma exhaust reprocessing.

52513 (LA-UR–90-3331) **Accelerator-driven neutron sources for materials research.** Jameson, R.A. Los Alamos National Lab., NM (USA). [1990]. 17p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-901116–3: 11. international conference on the application of accelerators in research and industry, Denton, TX (USA), 5-8 Nov 1990). Order Number DE91000181. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Particle accelerators are important tools for materials research and production. Advances in high-intensity linear accelerator technology make it possible to consider enhanced neutron sources for fusion material studies or as a source of spallation neutrons. Energy variability, uniformity of target dose distribution, target bombardment from multiple directions, time-scheduled dose patterns, and other features can be provided, opening new experimental opportunities. New designs have also been used to ensure hands-on maintenance on the accelerator in these factory-type facilities. Designs suitable for proposals such as the Japanese Energy-Selective Intense Neutron Source, and the international Fusion Materials Irradiation Facility are discussed.

52514 (NIFS-TECH–1) **Runaway-electron-materials interaction studies.** Bolt, H.; Miyahara, A. National Inst. for Fusion Science, Nagoya (Japan). Mar 1990. 174p. Order Number DE91713080. Source: NTIS (US Sales Only), PC A08/MF A01.

During the operation of magnetic fusion devices it has been frequently observed that runaway electrons can cause severe damage to plasma facing components. The energy of the runaway electrons could possibly reach several 100 MeV in a next generation device with an energy content in the plasma in the order of 100 MJ. In this study effects of high energy electron - materials interaction were determined by laboratory experiments using particle beam facilities, i.e. the Electron Linear Accelerator of the Institute of Scientific and Industrial Research of Osaka University and the 10 MW Neutral Beam Injection Test Stand of the National Institute for Fusion Science. The experiments and further analyses lead to a first assessment of the damage thresholds of plasma facing materials and components under runaway electron impact. It was found that metals (stainless steel, molybdenum, tungsten) showed grain growth, crack formation and/or melting already below the threshold for crack initiation on graphite (14-33 MJ/m^2). Strong erosion of carbon materials would occur above 100 MJ/m^2. Damage to metal coolant channels can occur already below an energy deposition of 100 MJ/m^2. The energy deposited in the metal coolant channels depends on the thickness of the plasma facing carbon material D, with the shielding efficiency S of carbon approximately as $S \approx D^{1.15}$. (author) 304 refs. 12 tabs. 59 figs.

52515 (ORNL/FTR–3745) **[Lead-lithium corrosion and chemistry]: Foreign trip report, August 27–September 7, 1990.** Tortorelli, P.F. Oak Ridge National Lab., TN (USA). 21 Sep 1990. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE91000381. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler participated in the 1990 European Workshop on Lead-Lithium Corrosion and Chemistry. Main areas of emphasis in the European liquid metal (exclusively Pb-17 at. % Li) program are now on deposition effects and corrosion-resistant surface product layers that can also serve as barriers to tritium permeation and insulators. Dr. Tortorelli also visited Harwell Laboratory to discuss innovative methods of corrosion analysis. He attended the 16th Symposium on Fusion Technology in London and the initial meeting of the Program Committee for the Second International Symposium on Fusion Nuclear Technology, which will be held in June 1991. He toured the JET facilities as part of the SOFT program.

52516 (PNL-SA–18521) **Measurements of activation cross sections for fusion reactor applications.** Greenwood, L.R. (Pacific Northwest Lab., Richland, WA (USA)); Bowers, D.L. Pacific Northwest Lab., Richland, WA (USA). Aug 1990. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-900814–14: 7. ASTM-EURATOM symposium on reactor dosimetry, Strasbourg (France), 27-31 Aug 1990). Order Number DE91000155. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Neutron activation cross section data are needed for fusion reactor materials to facilitate neutron dosimetry and to determine activity levels for waste disposal, safety, and reactor maintenance applications. Measurements are reviewed for 36 different reactions, many leading to long-lived nuclides. Irradiations were performed at 14 MeV at the RTNS II to fluences of 10^{18} n/cm^2. Activities were determined by either gamma and x-ray analysis or liquid scintillation counting following radiochemical separations to remove interfering activities. Results are compared to calculations with the ALICE computer code. Activity levels are predicted for the STARFIRE fusion reactor design and compared to previous estimates. Other work is summarized including rare earth irradiations in Be(d,n), H(t,n), and T(d,n) accelerator-based neutron sources with average energies of 3, 10, and 14 MeV, respectively.

52517 (PPPL–2681) **Cold fusion catalyzed by muons and electrons.** Kulsrud, R.M. Pacific Northwest Lab., Richland, WA (USA). Oct 1990. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE91000487. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Two alternative methods have been suggested to produce fusion power at low temperature. The first, muon catalyzed fusion or MCF, uses muons to spontaneousiy catalyze fusion through the muon mesomolecule formation. Unfortunately, this method fails to generate enough fusion energy to supply the muons, by a factor of about ten. The physics of MCF is discussed, and a possible approach to increasing the number of MCF fusions generated by each muon is mentioned. The second method, which has become known as "Cold Fusion," involves catalysis by electrons in electrolytic cells. The physics of this process, if it exists, is more mysterious than MCF. However, it now appears to be an artifact, the claims for its reality resting largely on experimental errors occurring in rather delicate experiments. However, a very low level of such fusion claimed by Jones may be real. Experiments in cold fusion will also be discussed.

52518 (UCLA/PPG–1135, pp. 15, Paper 1) **Overview of the TITAN-I fusion-power core.** Grotz, S.P. (Univ. of California, Los Angeles (USA)); Ghoniem, N.M. California Univ., Los Angeles, CA (USA); GA Technologies, Inc., San Diego, CA (USA); Los Alamos National Lab., NM (USA); Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Nuclear Engineering and Engineering Physics. Mar 1988. (CONF-880417–Pt.2: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). In *The TITAN Reversed-Field Pinch fusion reactor study. Collection of papers.* 174p. Order Number DE90001808. Source: NTIS, PC A08/MF A01.

The TITAN reactor is a compact (major radius of 3.9m and plasma minor radius of 0.6m), high neutron wall loading (~18 MW/m^2) fusion energy system based on the reversed-field pinch (RFP) confinement concept. The reactor thermal power is 2,918 MWt resulting in net electric output of 960 MWe and a mass power density of 700 kWe/tonne. The TITAN-I fusion power core (FPC) is a lithium, self-cooled design with vanadium alloy (V-3Ti-1Si) structural material. The surface heat flux incident on the first wall is ~4.5 MW/m^2. The magnetic field topology of the RFP is favorable for liquid metal cooling. In the TITAN-I design, the first wall and blanket consist of single pass, poloidal flow loops aligned with the dominant poloidal magnetic field. A unique feature of the TITAN-I design is the use of the integrated-blanket-coil (IBC) concept. With the IBC concept the poloidal flow lithium circuit is also the electrical conductor of the toroidal-field and divertor coils. Three dimensional neutronics analysis yields a tritium breeding ratio of 1.18 and a molten salt extraction technique is employed for the tritium extraction system. Almost every FPC component would qualify for Class C waste disposal. The compactness of the design allows the use of single-piece maintenance of the FPC. This maintenance procedure is expected to increase the plant availability. The entire FPC operates inside a vacuum tank, which is surrounded by an atmosphere of inert argon gas to impede the flow of air in the system in case of an accident. The top-side coolant supply and return virtually eliminate the possibility of a complete LOCA occurring in the FPC. The peak temperature during a LOFA is 991°C. 9 refs., 2 figs., 1 tab.

52519 (UCLA/PPG–1135, pp. 16, Paper 2) **Overview of the TITAN-II Reversed-Field Pinch aqueous fusion power core design.** Wong, C.P.C. (General Atomics Technologies Inc., San Diego, CA (USA)); Creedon, R.L.; Cheng, E.T.; Grotz, S.P.; Sharafat, S.; Cooke, P.I.H. California Univ., Los Angeles, CA (USA); GA Technologies, Inc., San Diego, CA (USA); Los Alamos National Lab., NM (USA); Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Nuclear Engineering and Engineering Physics. Mar 1988. (CONF-880417–Pt.2: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). In *The TITAN Reversed-Field Pinch fusion reactor study. Collection of papers.* 174p. Order Number DE90001808. Source: NTIS, PC A08/MF A01.

TITAN-II is a compact, high power density Reversed-Field Pinch fusion power reactor design based on the aqueous lithium solution fusion power core concept. The selected breeding and structural materials are $LiNO_3$ and 9-C low activation ferritic steel, respectively. TITAN-II is a viable alternative to the TITAN-I lithium self-cooled design for the Reversed-Field Pinch reactor to operate at a neutron wall loading of 18 MW/m^2. Submerging the complete fusion power core and the primary loop in a large pool of cool water will minimize the probability of radioactivity release. Since the protection of the large pool integrity is the only requirement for the protection of the public, TITAN-II is a level 2 of passive safety assurance design. 13 refs., 4 figs., 1 tab.

52520 (UCLA/PPG–1135, pp. 16, Paper 3) **The safety designs for the TITAN reversed-field pinch reactor study.** Wong, C.P.C. (General Atomics Technologies Inc., San Diego, CA (USA)); Cheng, E.T.; Creedon, R.L.; Hoot, C.G.; Schultz, K.R.; Grotz, S.P.; Blanchard, J.P.; Sharafat, S.; Najmabadi, F. California Univ., Los Angeles, CA (USA); GA Technologies, Inc., San Diego, CA (USA); Los Alamos National Lab., NM (USA); Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Nuclear Engineering and Engineering Physics. Mar 1988. (CONF-880417–Pt.2: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). In *The TITAN Reversed-Field Pinch fusion reactor study. Collection of papers.* 174p. Order Number DE90001808. Source: NTIS, PC A08/MF A01.

TITAN is a study to investigate the potential of the reversed-field pinch concept as a compact, high-power density energy system. Two reactor concepts were developed, a self-cooled lithium design with vanadium structure and an aqueous solution loop-in-pool design, both operating at 18 MW/m^2. The key safety features of the TITAN-I lithium-vanadium blanket design are in material selection, fusion power core configuration selection, lithium piping connections and passive lithium drain tank system. Based on these safety features and results from accident evaluation, TITAN-I can at least be rated as level 3 of safety assurance. For the TITAN-II aqueous loop-in-pool design, the key passive feature is the complete submersion of the fusion power core and the corresponding primary coolant loop system into a pool of low temperature water. Based on this key safety design feature, the TITAN-II design can be rated as level 2 of safety assurance. 7 refs., 2 figs.

52521 (UCLA/PPG–1135, pp. 20, Paper 4) **Activation and waste disposal of the TITAN RFP [reversed-field-pinch] reactors.** Cheng, E.T. (General Atomics Technologies Inc., San Diego, CA (USA)); Conn, R.W. California Univ., Los Angeles, CA (USA); GA Technologies, Inc., San Diego, CA (USA); Los Alamos National Lab., NM (USA); Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Nuclear Engineering and Engineering Physics. Mar 1988. (CONF-880417–Pt.2: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). In *The TITAN Reversed-Field Pinch fusion reactor study. Collection of papers.* 174p. Order Number DE90001808. Source: NTIS, PC A08/MF A01.

The TITAN-I lithium self-cooled and TITAN-II aqueous lithium nitrate solution-cooled fusion reactors are based on the reversed-field-pinch (RFP) toroidal confinement concept and operate at high power density with an 18.1 MW/m^2 neutron wall loading. These designs were analyzed to study the activation and waste disposal aspects of such high-power density reactors. It was found that because of the use of V-3Ti-1Si (TITAN-I) and reduced activation ferritic steel (TITAN-II) as structural alloys for the first wall, blanket, reflector, and shield components, all the TITAN components except the divertor collector plates can be classified as shallow-land burial (10CFR61 Class C or better) nuclear waste for disposal, provided that the impurity elements, niobium and molybdenum, can be controlled below about 1 and 0.3 appm levels, respectively. The average annual disposal masses were estimated to be 150 and 96 tonnes, respectively, for the 1,000 MW TITAN-I and TITAN-II reactors. This corresponds to about 11% of the total mass in the fusion power core of both reactors. The divertor collector plates are fabricated with tungsten because of its low particle sputtering properties. These divertor collector plates in the TITAN-I reactor will be qualified as Class C waste after 18.1 MW-y/m^2 operation. The waste disposal rating of the divertor collector plates in the TITAN-II reactor, however, is estimated to be a factor of 4 higher than allowed for Class C disposal, because of the soft neutron spectrum in the beryllium environment. The annual disposal mass of this non-Class C waste is 0.35 tons, about 0.04% of the average annual discharge mass for the TITAN-II reactor. An additional 74 m^3 annual discharge of Class C waste containing ^{14}C may be needed for the TITAN-II reactor because of the use of nitrate salt in the aqueous coolant as the tritium breeder. 13 refs., 6 tabs.

The TITAN reactor is a compact, high-power-density (neutron wall loading 18 MW/m^2) machine, based on the reversed-field-pinch (RFP) confinement concept. Two designs for the fusion power core have been examined; TITAN-I uses a self-cooled lithium loop with a vanadium-alloy structure for the first wall, blanket and shield, and TITAN-II is based on an aqueous loop-in-pool design with a $LiNO_3$ solution as the coolant and breeder. The compact design of the TITAN fusion power cores (FPCs) reduces the system to a few small and relatively low mass components, making toroidal segmentation of the FPC unnecessary. A single-piece maintenance procedure is possible. The potential advantages of single-piece maintenance procedures are: (1) shortest period of down time resulting from scheduled and unscheduled FPC repairs, (2) improved reliability resulting from integrated FPC pretesting in an on-site, non-nuclear test facility where coolant leaks, coil alignment, thermal expansion effects, etc., would be corrected prior to committing to nuclear service using rapid, and inexpensive, hands-on repair procedures, (3) no adverse effects resulting from the interaction of new materials operating in parallel to radiation damaged materials, and (4) ability to continually modify the FPC design as may be indicated by rector performance and technological developments. Increased availability can be expected from a fully pre-tested, single-piece FPC. Pre-testing of the FPC throughout the assembly process and prior to installation into the reactor vault is discussed. 6 refs., 4 figs., 4 tabs.

52523 (UCLA/PPG–1135, pp. 17, Paper 6) **Material selection for the TITAN reversed-field pinch reactor.** Sharafat, S. (Univ. of California, Los Angeles (USA)); Ghoniem, N.M.; Cooke, P.I.H. California Univ., Los Angeles, CA (USA); GA Technologies, Inc., San Diego, CA (USA); Los Alamos National Lab., NM (USA); Rensselaer Polytechnic Inst., Troy, NY (USA). The operating conditions of a compact, high neutron wall loading fusion reactor severely limit the choices for structural, shield, insulator and breeder materials. In particular the response of plasma-facing materials to radiation, thermal and pressure stresses, and their compatibility with coolants are of primary concern. Material selection issues were investigated for the compact, high mass power density TITAN reactor design study. In this paper the major findings regarding material performance are summarized. The retention of mechanical strength at relatively high temperatures, low thermal stresses, and compatibility with liquid lithium make vanadium-base alloys a promising material for structural components. The thermal creep behavior of V-3Ti-1Si and V-15Cr-5Ti alloys has been approximately. In addition, irradiation behavior including the effects of helium generation and coolant compatibility issues were investigated which led to the choice of V-3Ti-1Si as the primary structural material candidate for the liquid lithium cooled TITAN-I. For the water-cooled TITAN-II reactor, ferritic alloys are favored among structural material candidates. Depending on the choice of lithium salt dissolved in water, the radiolytic effects and corrosion characteristics of the aqueous breeding solution may be severe. LiOH and $LiNO_3$ have been identified as the most viable salts, however, radiolytic and corrosion behavior of these salts in aqueous solutions differ substantially. Insulator material issues of concern include irradiation induced swelling and radiation induced conductivity. Both issues have been investigated and operating temperatures for minimum swelling and dielectric breakdown strength have been identified for spinel ($MgO \cdot Al_2O_3$). The high heat flux and sputtering/erosion issues limit the choice of the materials for the divertor target plate. 18 refs., 2 figs., 2 tabs.

52524 (UCLA/PPG–1135, pp. 16, Paper 7) **Thermal-hydraulic and structural design for the lithium-cooled TITAN-I reversed-field-pinch reactor.** Hasan, M.Z. (Univ. of California, Los Angeles (USA)); Blanchard, J.P.; Ghoniem, N.M. California Univ., Los Angeles, CA (USA); GA Technologies, Inc., San Diego, CA (USA); Los Alamos National Lab., NM (USA); Rensselaer Polytechnic Inst., Troy, NY (USA). A thermal-hydraulic and structural design of the first wall and blanket for the 18 MW/m^2 neutron wall-loading TITAN reversed-field-pinch fusion reactor is presented. The primary coolant is liquid lithium and the structural material is the vanadium alloy, V-3Ti-1Si. Various design limits, which take the operational environment into consideration, for this vanadium alloy for the first wall and blanket are discussed. The first wall is made of small-diameter tubes. The blanket coolant channels are a combination of tubular, square, and rectangular channels. The first-wall and blanket coolant circuits are separate, allowing different coolant exit temperatures. The coolant channels are aligned with the larger poloidal magnetic field to reduce magnetohydrodynamic (MHD) pressure drops. At the design heat flux of 4.6 MW/m^2 on the first wall, MHD turbulent-flow heat transfer is used. Both the separation of the coolant circuits and the use of MHD turbulent-flow heat transfer substantially increase the heat flux limit on the first wall. These are favorable for high-power-density fusion reactors. The inlet temperature of lithium is 320°C and the exit temperatures are 440°C and 700°C for the first wall and blanket, respectively. The pressure drop in the first wall circuit is 10 MPa and is less than 3 MPa for the blanket circuit. The pumping power is less than 5% of electric output. The maximum structure temperature is less than 750°C and the material stresses are shown to be within the allowable limits. One-dimensional thermal and stress analyses are adequate for the thermal-hydraulic and structural design for TITAN-I. This is verified by two-dimensional, finite element analysis. 17 refs., 4 figs., 1 tab.

52525 (UCLA/PPG–1135, pp. 16, Paper 8) **A optimum Rankine power cycle for the lithium-cooled TITAN-I reversed-field-pinch reactor.** Hasan, M.. (Univ. of California, Los Angeles (USA)); Sze, D.K. California Univ., Los Angeles, CA (USA); GA Technologies, Inc., San Diego, CA (USA); Los Alamos National Lab., NM (USA); Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Nuclear Engineering and Engineering Physics. Mar 1988. (CONF-880417–Pt.2: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). In *The TITAN Reversed-Field Pinch fusion reactor study. Collection of papers.* 174p. Order Number DE90001808. Source: NTIS, PC A08/MF A01.

A thermal power cycle for the TITAN-I fusion reactor is presented. The TITAN is a compact, high-power-density (neutron wall loading 18 MW/m^2) reactor based on the reversed-field pinch (RFP) confinement concept. The TITAN-I incorporates a fusion power core design with liquid-lithium as the coolant and breeder and vanadium alloy (V-3Ti-1Si) as the structural material. The total thermal power of TITAN-I is 2,918 MW$_t$. Of this total thermal power, 736 MW$_t$ is removed by the first-wall coolant, 29 MW$_t$ by the divertor coolant and the rest 2,153 MW$_t$ by the blanket coolant. The primary coolant inlet temperature is 320°C. The exit temperatures are 440°C, 540°C and 700°C for the first-wall, divertor and blanket coolants, respectively. Coolants from the first wall and divertor are mixed upon exit which gives the first-wall/divertor mixed exit temperature of 442°C. The blanket coolant is kept separate. The coolant flow rates in the first-wall, divertor and blanket circuits are 1,464, 31 and 1,350 Kg/sec, respectively. Liquid-lithium is also chosen as the secondary coolant in the intermediate heat exchangers. Several power-cycle modifications are considered. The selected power cycle has two components-one for the conversion of the thermal power in the first wall and divertor coolants, and the other for conversion of the thermal power in the blanket coolant which is at much higher thermal potential. The power cycle for the first wall and divertor is a non-reheat, superheat Rankine cycle with 4 stages of regenerative feed water heating. The pressure and temperature of the throttle steam are 1,500psia and 396°C, respectively. This results in a gross thermal efficiency of 37%. The power cycle for blanket is a Rankine cycle with 2-stage reheat and 7 stages of regenerative feed water heating. 10 refs., 4 figs., 2 tabs.

52526 (UCLA/PPG–1135, pp. 17, Paper 9) **Engineering design of the TITAN-II divertor.** Cooke, P.I.H. (Univ. of California, Los Angeles (USA)); Blanchard, J.P.; Grotz, S.P.; Hasan, M.Z.; Sharafat, S.; Bathke, C.G. California Univ., Los Angeles, CA (USA); GA Technologies, Inc., San Diego, CA (USA); Los Alamos National Lab., NM (USA); Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Nuclear Engineering and Engineering Physics. Mar 1988. (CONF-880417–Pt.2: 1. international symposium on fusion nuclear technology (ISFNT), Tokyo (Japan), 10-19 Apr 1988). In *The TITAN Reversed-Field Pinch fusion reactor study. Collection of papers.* 174p. Order Number DE90001808. Source: NTIS, PC A08/MF A01.

The design of the toroidal-field divertor for the TITAN-II reversed-field-pinch reactor is described. Strong radiation from the core and edge plasma spreads the heat load over the first wall and divertor areas of the high-power-density reactor, and careful shaping of the divertor target plate restricts the maximum heat flux to ~7.5 MW/m^2. A further feature leading to manageable heat fluxes is the open configuration for the divertor, in which the target plate is located close to the null point to take advantage of the expansion of magnetic flux. The divertor target is constructed from a single material, a tungsten-rhenium alloy, for both the armor and coolant tubes, to avoid stress concentrations which arise at the interface between different materials. This alloy was chosen for its high ductility and good thermal and mechanical properties, which are retained at high temperatures, and for its excellent resistance to erosion by sputtering in the anticipated divertor plasma conditions. Detailed finite-element modeling of the divertor target indicates a peak equivalent thermal stress in the armor of ~500 MPa. Fabrication of the divertor plate is based on brazing the bank of coolant tubes to the armor, all components being manufactured using powder metallurgy techniques. The coolant for the divertor plate is an aqueous $LiNO_3$ solution, with a lithium atomic percentage of 6.4%, as used throughout the fusion power core. Consideration of the thermal and physical properties of this solution allows coolant conditions to be chosen such that an adequate safety margin for critical heat flux is provided. 10 refs., 5 figs.

Aqueous solutions of Li-containing compounds have been proposed to serve as the combined tritium breeding material and coolant for fusion reactors. The salt used for the TITAN-II reversed-field-pinch reactor design is $LiNO_3$, which was chosen for its good neutronics properties, relatively good corrosion characteristics, and for its high solubility in water. An extensive literature survey has shown that the physical and thermal properties of high-temperature, concentrated aqueous $LiNO_3$ solutions are markedly different from the pure water properties at similar conditions. These changes alter the heat transfer performance of the coolant, and the critical heat flux is estimated to rise for sub-cooled flow boiling, while the heat transfer coefficient for forced convection falls. Another important result is the elevation in boiling point, which may allow the operating pressure of the primary coolant to be reduced to a value below that of the secondary steam circuit, preventing leakage of the tritiated coolant into the steam circuit. Further research is needed into corrosion and radiolysis issues, but the available data imply that careful control of the coolant chemistry can minimize the problems. 26 refs., 5 figs.

52528 (UCRL–100531) **A model for the prediction of Nb_3Sn critical current as a function of field, temperature, strain, and radiation damage.** Summers, L.T.; Guinan, M.W.; Miller, J.R.; Hahn, P.A. Lawrence Livermore National Lab., CA (USA). 21 Sep 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-900944–7: Applied superconductivity conference, Aspen, CO (USA), 24-28 Sep 1990). Order Number DE91000656. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Conductors designed for fusion machines must operate at high fields, under large mechanical loads, and in a high neutron flux. Present designs favor the use of Nb_3Sn with force-cooling by supercritical helium to extract large nuclear and ac loss heat loads. Consequently, the magnet designer must have a good knowledge of the critical current of the superconductor as a function of field, strain, temperature, and radiation damage. Expanding on work by Hampshire, et al. and Ekin, combined with radiation damage studies of Nb_3Sn, we express the critical field (B_{c20}) as function of temperature, strain and damage energy (E_d). Similarly, the zero-field critical temperature (T_{c0}) is expressed as a function of strain and damage energy. The expressions of B_{c20} and T_{c0} are combined into a functional form that allows an accurate and consistent estimate of the critical current density at the operating conditions of fusion magnet conductors. 9 refs., 4 figs.

52529 (UCRL–101648) **Laser driven instabilities in inertial confinement fusion.** Kruer, W.L. Lawrence Livermore National Lab., CA (USA). 4 Jun 1990. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900264–9: Topical conference on research trends in nonlinear and relativistic effects in plasmas, San Diego, CA (USA), 5-8 Feb 1990). Order Number DE91000402. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Parametric instabilities excited by an intense electromagnetic wave in a plasma is a fundamental topic relevant to many applications. These applications include laser fusion, heating of magnetically-confined plasmas, ionospheric modification, and even particle acceleration for high energy physics. In laser fusion, these instabilities have proven to play an essential role in the choice of laser wavelength. Characterization and control of the instabilities is an ongoing priority in laser plasma experiments. Recent progress and some important trends will be discussed. 8 figs.

52530 (UCRL-CR–103908) **An approximate method for analyzing transient condensation on spray in HYLIFE-II.** Bai, R.Y. (California Univ., Berkeley, CA (USA). Dept. of Nuclear Engineering); Schrock, V.E. Lawrence Livermore National Lab., CA (USA); California Univ., Berkeley, CA (USA). Dept. of Nuclear Engineering. [1990]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-901007–12: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000947. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The HYLIFE-II conceptual design calls for analysis of highly transient condensation on droplets to achieve a rapidly decaying pressure field. Drops exposed to the required transient vapor pressure field are first heated by condensation but later begin to reevaporate after the vapor temperature falls below the drop surface temperature. An approximate method of analysis has been developed based on the assumption that the thermal resistance is concentrated in the liquid. The time dependent boundary condition is treated via the Duhamel integral for the pure conduction model. The resulting Nusselt number is enhanced to account for convection within the drop and then used to predict the drop mean temperature history. Many histories are considered to determine the spray rate necessary to achieve the required complete condensation.

52531 (UCRL-CR–103909) **The pressure relaxation of liquid jets after isochoric heating.** Chen, X.M. (California Univ., Berkeley, CA (USA). Dept. of Nuclear Engineering); Schrock, V.E. Lawrence Livermore National Lab., CA (USA); California Univ., Berkeley, CA (USA). Dept. of Nuclear Engineering. [1990]. 21p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-901007–11: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000946. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During isochoric heating by fast neutron irradiation, a high pressure is almost instantaneously built up inside the falling liquid jets in a HYLIFE (ICF) reactor. It has been suggested that the jets will breakup as a consequence of negative pressure occurring during the relaxation. This is important to both the subsequent condensation process and the chamber wall design. In this paper the mechanism of the relaxation of liquid jets after isochoric heating has been studied with both incompressible and compressible models. The transient pressure field predicted is qualitatively similar for both models and reveals a strongly peaked tension in the wake of a rarefaction wave. The pressure then rises monotonically in radius to zero pressure on the boundary. The incompressible approximation greatly over predicts the peak tension, which increases with time as the rarefaction wave moves toward the center of the jet. Since the tension distribution is as a narrow spike rather than uniform, a cylindrical fracture is the most likely mode of failure. The paper also discusses the available methods for estimating liquid tensile strength.

52532 (UCRL-CR–103910) **Pressure and impulse scaling methods for wall impact in ICF [inertial confinement fusion].** Liu, J.C. (California Univ., Berkeley, CA (USA). Dept. of Nuclear Engineering); Chen, X.M.; Schrock, V.E.; Orth, C.D. Lawrence Livermore National Lab., CA (USA). [1990]. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-901007–14: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000949. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The design of the first structural wall (FSW) in an inertial confinement fusion (ICF) reactor requires some knowledge of the expected wall loading produced by x-ray and neutron deposition; specifically in the High Yield Lithium Injection Fusion Energy (HYLIFE) reactor, wall loading results from two sources – gas shock and liquid impact. Gas shock is derived from x-ray deposition in the thin layers of exposed blanket material, producing ionized vapor, which will generate gas shock on the FSW. Liquid impact, on the other hand, results from the acceleration of liquid blanket material by two possible forces – the drag from vapor expansion through the blanket material and the neutron-induced isochoric disassembly process. Both impacts, however, are coupled by the interaction of hot gas expanding through the liquid blanket. This paper discusses scaling methods for estimating pressure and impulse on the HYLIFE FSW from these impacts. In particular, this paper reviews simple analytical and numerical techniques, and the use of experimental results in the estimation of wall impacts for the HYLIFE blanket geometry. Considered important in the analyses are supersonic flow through jet arrays and isochoric disassembly. Given the same initial parameters as those used in previous HYLIFE studies, the techniques described here yield results comparable to the previous studies utilizing heavy numerical simulation.

52533 (UCRL-JC–101185) **A fuel pellet injector for the Microwave Tokamak Experiment (MTX).** Hibbs, S.M.; Allen, S.L.; Petersen, D.E.; Sewall, N.R. Lawrence Livermore National Lab., CA (USA). Sep 1990. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-901035–3: 37. national American Vacuum Society symposium, Toronto (Canada), 8-12 Oct 1990). Order Number DE91000789. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Unlike other fueling systems for magnetically confined fusion plasmas, a pellet injector can deliver many fuel gas particles to the core of the plasma, enhancing plasma confinement. We installed a new pellet injector on the MTX (formerly Alcator-O) to provide a plasma with a high core density for experiments both with and without ultrahigh-power microwave heating. Its four-barrel pellet generator is the first to be designed and built at LLNL. Based on 'pipe-gun" technology originated at Oak Ridge National Laboratory (ORNL), it incorporates our structural and thermal engineering innovations and a unique control system. The pellet transport, differential vacuum-pumping stages, and fast-opening propellant valves are reused parts of the Impurity Study EXperiment (ISX) pellet injector built by ORNL. We tailored designs of all other systems and components to the MTX. Our injector launches pellets of

frozen hydrogen or deuterium into the MTX, either singly or in timed bursts of up to four pellets at velocities of up to 1000 m/s. Pellet diameters range from 1.02 to 2.08 mm. A diagnostic stage measures pellet velocities and allows us to photograph the pellets in flight. We are striving to improve the injector's performance, but its operations is already very consistent and reliable.

52534 (UCRL-JC–103285) **Design of a neutron penumbral-aperture microscope with 10-μm resolution.** Ress, D.; Lerche, R.A.; Ellis, R.J.; Lane, S.M. Lawrence Livermore National Lab., CA (USA). May 1990. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-900557–15: 8. topical conference on high-temperature plasma diagnostics, Hyannis, MA (USA), 6-10 May 1990). Order Number DE91000788. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We are currently designing a 10-μm resolution neutron penumbral-aperture microscope to diagnose high-convergence targets at the Nova laser facility. To achieve such high resolution, the new microscope will require substantial improvements in three areas. First, we have designed thick penumbral apertures with extremely sharp cutoffs over a useful ($\approx$100 μm) field of view; fabrication of such apertures appears feasible using gold electroplating techniques. Second, the limited field of view and required close proximity of the aperture to the target (2 cm) necessitates a durable mounting and alignment system with +25 μm accuracy. Finally, a neutron detector containing 160,000 scintillator elements is required; readout and optimization of this large array are outstanding issues. 5 refs., 3 figs.

52535 (UCRL-JC–103490) **A conceptual design of the International Thermonuclear Experimental Reactor for the Central Solenoid.** Heim, J.R.; Parker, J.M. Lawrence Livermore National Lab., CA (USA). 21 Sep 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-900944–8: Applied superconductivity conference, Aspen, CO (USA), 24-28 Sep 1990). Order Number DE91000655. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Conceptual design of the International Thermonuclear Experimental Reactor (ITER) superconducting magnet system is nearing completion by the ITER Design Team, and one of the Central Solenoid (CS) designs is presented. The CS part of this magnet system will be a vertical stack of eight modules, approximately 16 m high, each having a approximate dimensions of: 4.1-m o.d., 2.8-m i.d., 1.9-m h. The peak field at the bore is approximately 13.5 T. Cable-in-conduit conductor with Nb_3Sn composite wire will be used to wind the coils. The overall coil fabrication will use the insulate-wind-react-impregnate method. Coil modules will be fabricated using double-pancake coils with all splice joints located in the low-field region on the outside of the coils. All coils will be structurally graded with high-strength steel reinforcement which is co-wound with the conductor. We describe details of the CS coil design and analysis.

52536 (UCRL-JC–103596) **FENIX [Fusion ENgineering International eXperimental]: A test facility for ITER [International Thermonuclear Experimental Reactor] and other new superconducting magnets.** Slack, D.S.; Patrick, R.E.; Miller, J.R. Lawrence Livermore National Lab., CA (USA). 21 Sep 1990. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-900944–9: Applied superconductivity conference, Aspen, CO (USA), 24-28 Sep 1990). Order Number DE91000654. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The Fusion ENgineering International eXperimental (FENIX) Test Facility which is nearing completion at Lawrence Livermore National Laboratory, is a 76-t set of superconducting magnets housed in a 4-m-diameter cryostat. It represents a significant step toward meeting the testing needs for the development of superconductors appropriate for large-scale magnet applications such as the International Thermonuclear Experimental Reactor (ITER). The magnet set is configured to allow radial access to the 0.4-m-diameter high-field region where maximum fields up to 14 T will be provided. The facility is fitted with a thermally isolated test well with a port to the high-field region that allows insertion and removal of test conductors without disturbing the cryogenic environment of the magnets. It is expected that the facility will be made available to magnet developers internationally, and this paper discusses its general design features, its construction, and its capabilities.

52537 (UCRL-JC–103815) **Parametric cost analysis of a HYLIFE-II power plant.** Bieri, R.L. (Lawrence Livermore National Lab., CA (USA)). Lawrence Livermore National Lab., CA (USA). 4 Oct 1990. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-901007–10: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000945. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The SAFIRE (Systems Analysis for ICF Reactor Economics) code was adapted to model a power plant using a HYLIFE-II reactor chamber. The code was then used to examine the dependence of the plant capital costs and busbar cost of electricity (COE) on a variety of design parameters (type of driver, chamber repetition rate, and net electric power). The results show the most attractive operating space for each set of driver/target assumptions and quantify the benefits of improvements in key design parameters. The base case plant was a 1,000 MWe plant containing a reactor vessel driven by an induction linac heavy ion accelerator run at 7.3 Hz with a driver energy of 5 MJ and a target yield of 370 MJ. The total direct cost for this plant was 2,800 M$ (where all $ in this paper are 1988$s), and the COE was 9 ¢/KW*hour. The COE and total capital costs for the base plant assumptions for a 1,000 MWe plant are approximately independent of chosen repetition rate for all repetition rates between 4 and 10 Hz. For comparison, the COE for a coal or future fission plant would be 4.5–5.5 ¢/KW*hour. The COE for a 1,000 MWe plant could be reduced to 7.6 ¢/KW*hour by using advanced targets and could be cut to 6.8 ¢/KW*hour with conventional targets if the driver cost could be cut in half. There is a large economy of scale with heavy ion driven ICF plants; a 5,000 MWe plant with one heavy ion driver and either one or two HYLIFE-II chambers would have a COE of only 4.4 ¢/KW*hour.

52538 (UCRL-JC–103816) **HYLIFE-2 inertial confinement fusion reactor design.** Moir, R.W. Lawrence Livermore National Lab., CA (USA). 4 Oct 1990. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-901007–6: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000792. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The HYLIFE-II inertial fusion power plant design study uses a liquid fall, in the form of jets to protect the first structural wall from neutron damage, x-rays, and blast to provide a 30-y lifetime. HYLIFE-I used liquid lithium. HYLIFE-II avoids the fire hazard of lithium by using a molten salt composed of fluorine, lithium, and beryllium (Li_2BeF_4) called Flibe. Access for heavy-ion beams is provided. Calculations for assumed heavy-ion beam performance show a nominal gain of 70 at 5 MJ producing 350 MJ, about 5.2 times less yield than the 1.8 GJ from a driver energy of 4.5 MJ with gain of 400 for HYLIFE-I. The nominal 1 GWe of power can be maintained by increasing the repetition rate by a factor of about 5.2, from 1.5 to 8 Hz. A higher repetition rate requires faster re-establishment of the jets after a shot, which can be accomplished in part by decreasing the jet fall height and increasing the jet flow velocity. Multiple chambers may be required. In addition, although not considered for HYLIFE-I, there is undoubtedly liquid splash that must be forcibly cleared because gravity is too slow, especially at high repetition rates. Splash removal can be accomplished by either pulsed or oscillating jet flows. The cost of electricity is estimated to be 0.09$/kW·h in constant 1988 dollars, about twice that of future coal and light water reactor nuclear power. The driver beam cost is about one-half the total cost. 12 refs., 9 figs., 5 tabs.

52539 (UCRL-JC–103817) **Grazing incidence metal mirrors as the final elements in a laser driver for inertial confinement fusion.** Bieri, R.L.; Guinan, M.W. Lawrence Livermore National Lab., CA (USA). 4 Oct 1990. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-901007–9: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000944. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Grazing incidence metal mirrors (GIMMS) have been examined to replace dielectric mirrors for the final elements in a laser beam line for an inertial confinement fusion (ICF) reactor. For a laser driver using light with a wavelength from 250 to 500 nm in a 10 ns pulse, irradiated mirrors made of Al, Al alloys, or Mg were found to

have calculated laser damage limits of 0.3–2.3 J/cm^2 of beam energy and neutron lifetime fluence limits of over 5 x 10^{20} neutrons per square centimeter when use at grazing incidence (an angle of incidence of 85 degrees) and operated at room temperature or at 77 K. A final focusing system including mirrors made of Al alloy 7475 at room temperature or at liquid nitrogen (LN) temperatures used with a driver which delivers 5 MJ of beam energy in 32 beams would require 32 mirrors of roughly 10 m^2 each. This paper briefly reviews the methods used in calculating the damage limits for GIMMs and discusses critical issues relevant to the integrity and lifetime of such mirrors in a reactor environment. 9 refs.

52540 (UCRL-JC–103818) **Oscillating liquid flow ICF [inertial confinement fusion] reactor.** Petzoldt, R.W. Lawrence Livermore National Lab., CA (USA). 4 Oct 1990. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-901007–7: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000793. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Oscillating liquid flow in a falling molten salt inertial confinement fusion reactor is predicted to rapidly clear driver beam paths of residual molten salt. Oscillating flow will also provide adequate neutron and x-ray protection for the reactor structure with a short (2-m) fall distance permitting an 8 Hz repetition rate. A reactor chamber configuration is presented with specific features to clear the entire heavy-ion beam path of splashed molten salt. The structural components, including the structure between beam ports, are shielded. 3 refs., 12 figs.

52541 (UCRL-JC–103938) **The cascade ICF reactor with an x-ray and debris shield and a heavy-ion driver.** Pitts, J.H.; Tabak, M. Lawrence Livermore National Lab., CA (USA). 28 Sep 1990. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-901007–5: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000791. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The use of a 1-kg solid-lithium x-ray and debris shield around each fusion fuel pellet prevents vaporization of, and destructive shock waves in, the Cascade blanket granules thereby increasing their lifetime. The shield vaporizes as it absorbs energy and the vapor flows into the blanket several centimeters. The shield also increases tritium breeding and enhances vacuum pumping of high Z materials that are vaporized in the fuel pellet. Using heavy ion beams allows illumination of the fuel pellets with the restricted geometry present in Cascade. We used a 5 MJ driver with 18 beams (one 3 x 3 array from each end).

52542 (UCRL-JC–104182) **Some applications of mirror-generated electric potentials to alternative fusion concepts.** Post, R.F. Lawrence Livermore National Lab., CA (USA). 24 Sep 1990. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-9010209–1: Workshop on physics of alternative magnetic confinement schemes, Varenna (Italy), 14-15 Oct 1990). Order Number DE91000973. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Transient electrical potentials can be generated in plasmas by utilizing impulsive mirror-generated forces acting on the plasma electrons together with ion inertia to cause momentary charge imbalance. In the Mirrortron such potentials are generated by applying a rapidly rising (tens of nanoseconds) localized mirror field to the central region of a hot-electron plasma confined between static mirrors. Because of the loss-cone nature of the electron distribution the sudden appearance of the pulsed mirror tends to expel electrons, whereas the ion density remains nearly constant. The quasi-neutrality condition then operates to create an electrical potential the equipotential surfaces of which can be shown theoretically to be congruent with surfaces of constant B. An alternative way of generating transient potentials is to apply a pulse of high-power microwaves to a plasma residing on a magnetic field with a longitudinal gradient. This technique resembles one employed in the Pleiade experiments. At gigawatt power levels, such as those produced by a Free Electron Laser, the production of very high transient potentials is predicted. Fusion-relevant applications of these ideas include heavy-ion drivers for inertial fusion, and the possibility of employing these techniques to enhance the longitudinal confinement of fusion plasmas in multiple-mirror systems. 23 refs., 3 figs.

52543 (UCRL-JC–104418) **Particle distributions in collisionless magnetic reconnection: An implicit Particle-In-Cell (PIC) description.** Hewett, D.W.; Francis, G.E.; Max, C.E. Lawrence Livermore National Lab., CA (USA). 29 Jun 1990. 24p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9006220–5: 28. COSPAR plenary conference, The Hague (Netherlands), 25 Jun - 6 jul 1990). Order Number DE91000404. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Evidence from magnetospheric and solar flare research supports the belief that collisionless magnetic reconnection can proceed on the Alfven-wave crossing timescale. Reconnection behavior that occurs this rapidly in collisionless plasmas is not well understood because underlying mechanisms depend on the details of the ion and electron distributions in the vicinity of the emerging X-points. We use the direct implicit Particle-In-Cell (PIC) code AVANTI to study the details of these distributions as they evolve in the self-consistent E and B fields of magnetic reconnection. We first consider a simple neutral sheet model. We observe rapid movement of the current-carrying electrons away from the emerging X-point. Later in time an oscillation of the trapped magnetic flux is found, superimposed upon continued linear growth due to plasma inflow at the ion sound speed. The addition of a current-aligned and a normal B field widen the scope of our studies.

52544 (UCRL-JC–104573) **ECH by FEL and gyrotron sources on the Microwave Tokamak Experiment (MTX) tokamak.** Stallard, B.W. (Lawrence Livermore National Lab., CA (USA)); Turner, W.C.; Allen, S.L.; Byers, J.A.; Felker, B.; Fenstermacher, M.E.; Ferguson, S.W.; Hooper, E.G.; Thomassen, K.I.; Throop, A.L.; Makowski, M.A. Lawrence Livermore National Lab., CA (USA). 9 Aug 1990. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-900918–6: 16. symposium on fusion technology, London (UK), 3-7 Sep 1990). Order Number DE91000286. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The Microwave Tokamak Experiment (MTX) at LLNL is studying the physics of intense pulse ECH is a high-density tokamak plasma using a microwave FEL. Related technology development includes the FEL, a windowless quasi-optical transmission system, and other microwave components. Initial plasma experiments have been carried out at 140 GHz with single rf pulses generated using the ETA-II accelerator and the ELF wiggler. Peak power levels up to 0.2 GW and pulse durations up to 10 ns were achieved for injection into the plasma using as untapered wiggler. FEL pulses were transmitted over 33 m from the FEL to MTX using six mirrors mounted in a 50-cm-diam evacuated pipe. Measurements of the microwave beam and transmission through the plasma were carried out. For future rapid pulse experiments at high average power (4 GW peak power, 5kHz pulse rate, and $\bar{P} > 0.5$ MW) using the IMP wiggler with tapered magnetic field, a gyrotron (140 GHz, 400 kW cw or up to 1 MW short pulse) is being installed to drive the FEL input or to directly heat the tokamak plasma at full gyrotron power. Quasi-optic techniques will be used to couple the gyrotron power. For direct plasma heating, the gyrotron will couple into the existing mirror transport system. Using both sources of rf generation, experiments are planned to investigate intense pulse absorption and tokamak physics, such as the ECH of a pellet-fueled plasma and plasma control using localized heating. 12 refs., 9 figs.

52545 (UCRL-JC–104849) **Fusion energy: Progress in the design of the international thermonuclear experimental reactor (ITER).** Lawrence Livermore National Lab., CA (USA). Sep 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-900608–Absts.: American Nuclear Society annual meeting, Nashville, TN (USA), 10-14 Jun 1990). Order Number DE91000801. Source: NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The main purpose of the International Thermonuclear Experimental Reactor (ITER) is to develop an experimental fusion reactor through the united efforts of many technologically advanced countries. The ITER terms of reference, issued jointly by the European Community, Japan, the USSR, and the United States, call for an

integrated international design activity and constitute the basis of current activities. Joint work on ITER is carried out under the auspices of the International Atomic Energy Agency (IAEA), according to the terms of quadripartite agreement reached between the European Community, Japan, the USSR, and the United States. The site for joint technical work sessions is at the MaxPlanck Institute of Plasma Physics. Garching, Federal Republic of Germany. The ITER activities have two phases: a definition phase performed in 1988 and the present design phase (1989–1990). During the definition phase, a set of ITER technical characteristics and supporting research and development (R&D) activities were developed and reported. The present conceptual design phase of ITER lasts until the end of 1990. The objectives of this phase are to develop the design of ITER, perform a safety and environmental analysis, develop site requirements, define future R&D needs, and estimate cost, manpower, and schedule for construction and operation. A final report will be submitted at the end of 1990. This paper summarizes progress in the ITER program during the 1989 design phase.

52546 (UCRL-JC–105033) **The heat transport system and plant design for the HYLIFE-2 fusion reactor.** Hoffman, M.A. Lawrence Livermore National Lab., CA (USA). 21 Aug 1990. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-901007–8: 9. topical meeting on technology of fusion energy, Oak Brook, IL (USA), 7-11 Oct 1990). Order Number DE91000787. Source: NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

HYLIFE is the name given to a family of self-healing liquid-wall reactor concepts for inertial confinement fusion. This HYLIFE-II concept employs the molten salt, Flibe, for the liquid jets instead of liquid lithium used in the original HYLIFE-I study. A preliminary conceptual design study of the heat transport system and the balance of plant of the HYLIFE-II fusion power plant is described in this paper with special emphasis on a scoping study to determine the best intermediate heat exchanger geometry and flow conditions for minimum cost of electricity. 11 refs., 8 figs.

52547 **Reconstruction of m = 1 MHD modes from projections.** Sauthoff, N.R. (Princeton Univ., NJ (USA)); McGuire, K.M.; Von Goeler, S. pp. N4 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper describes a method for the inversion of line integral data from a single-view of rotating plasma based on a harmonic decomposition of the poloidal structure. A simulation program generates sample data based on the assumption of a slowly-evolving plasma with a displaced central hot-spot and a plateau near the radius of the q = 1 surface. The sample data are decomposed into time windows to permit reconstructions are compared to the source data. Applicability to experimental tokamak data is discussed.

52548 **Use of graphite in Langmuir-calorimeter probe heads.** Kilpatrick, S. (Princeton Univ., NJ (USA)); Manos, D.; Ritter, R.; Stangeby, P. pp. K6 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

K6.

This paper discusses graphite which has become an important material in magnetically confined fusion devices, being used for components such as limiter blades, divertor plates and Faraday shields. Langmuir-calorimeter probes on TFTR and PLT have utilized ATJ graphite in probe heads, active elements, protective shields and in an epoxy compound for various applications. Most recently, all-graphite edge probes have been used successfully on these machines. The advantages and disadvantages of using this material as a collecting element and a heat resistant support are discussed, with reference to its survivability and usefulness in the TFTR environment. A two-dimensional finite-element thermal analysis of a TFTR graphite calorimeter is presented which calculates its temperature response to selected power inputs. This was used to estimate power densities a the edge of TFTR plasmas.

52549 **The TFTR Mirnov loop system.** Fredrickson, E. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Colchin, R.; McGuire, K; Sauthoff, N. pp. K11 of Proceedings of the 6th topical conference on high temperature plasma diagnostics. Princeton Plasma Physics Laboratory, Princeton, NJ (USA) (1986). pp. 92 (CONF-860324–: 6. topical conference on high temperature plasma diagnostics, Hilton Head Island, SC (USA), 9-13 Mar 1986).

This paper discusses magnetic pick-up loops (Mirnov coils) located on the inner wall of the TFTR vacuum vessel used to study magnetic fluctuations in the plasma. To study the high frequency magnetic turbulence associated with beam injection, the signal from one coil is passed through a comb filter, which gives a measure of the frequency spectrum throughout the shot. To look for tearing modes, the signals from a poloidal array of fifteen coils are summed in an analog system to give the amplitudes of the m = 2, m = 3 and m = 4 coherent modes throughout the shot. Twenty coil signals are digitized individually at a rate of 100kHz for 80 ms and at 10kHz for 800 ms. This data may be analyzed off line to get both the toroidal and poloidal mode numbers as well as frequency spectrum information for a limited portion of the discharge.

52550 **The moon: An abundant source of clean and safe fusion fuel for the 21st century.** Kulcinski, G.L. (Wisconsin Univ., Madison, WI (USA). Dept. of Nuclear Engineering and Engineering Physics); Schmitt, H.H. pp. 525-554 of Fueling the 21st century. Sheindlin, A.E.; Zaleski, P. Hemisphere Publishing, New York, NY (USA) (1989). pp. 860

This paper discusses the possibility of an inherently safe nuclear power source in the 21st century. The discovery of a large source of energy on the moon is described. Establishment of lunar bases is examined.

52551 **Comparison of four concepts for an inertial-confinement-fusion power plant.** Pitts, J.H. (Lawrence Livermore National Laboratory, CA (USA)); Bangerter, R.O.; Moir, R.W. *Transactions of the American Nuclear Society (USA)*, 59: 104-105 (1989). (CONF-890604–: Annual meeting of the American Nuclear Society, Atlanta, GA (USA), 4-8 Jun 1989).

Fusion has the potential to be a safe, clean and abundant energy source for producing electrical power in the next century-perhaps just as fossil fuel becomes scarce and its adverse environmental effects become significant. A program to develop concepts for inertial-confinement-fusion (ICF) power plants that produce electricity was initiated at the Lawrence Livermore National Laboratory ~10 yr ago. Studies have been completed on a number of ICF reactor concepts used in these power plants and are now evaluating two additional reactor concepts. Two of the concepts that have already been evaluated, HYLIFE and Cascade, are particularly attractive. This paper compares the advantages of HYLIFE and Cascade with the two reactors currently being evaluated. 3 refs.

52552 **Rejuvenation of CANDU [Canada deuterium uranium] spent fuel in a hybrid blanket.** Sahin, S. (Gazi Univ. (Turkey)); Yapici, H. *Transactions of the American Nuclear Society (USA)*, 59: 105-106 (1989). (CONF-890604–: Annual meeting of the American Nuclear Society, Atlanta, GA (USA), 4-8 Jun 1989).

The existing nuclear power plants can utilize only a small fraction of their fissile fuel. The possibility of the rejuvenation of spent nuclear fuel in a hybrid blanket is an attractive application field for early-generation fusion reactors. In the past, this option was investigated for light water reactor spent fuel. Little attention has been paid to the rejuvenation of spent Canada deuterium uranium (CANDU) fuel, although this type of rector has the lowest burnup rate per fuel mass, and consequently the highest ratio of spent-fuel mass/burnup. At present, there are many CANDU reactors in operation, and a substantial quantity of spent fuel is being stored without any clearly defined plans for future use. In this work, a hybrid blanket is investigated that contains CANDU spent fuel. The main objective is to study the rejuvenation behavior in a hybrid blanket coupled with substantial in situ electricity production. 12 refs., 2 figs., 1 tab.

52553 **Mixed-DT neutral-beam injection: An alternative heating method for tokamaks.** Ruby, L. (Univ. of California, Berkeley (USA)); Lewis, M.S. *Transactions of the American Nuclear Society*

(USA), 59: 107-108 (1989). (CONF-890604--: Annual meeting of the American Nuclear Society, Atlanta, GA (USA), 4-8 Jun 1989).

In this paper, the authors propose an alternative method for the heating, and perhaps also refueling, of tokamak fusion devices. The alternative method replaces the deuterium neutral-beam injectors (NBIs) such as those now used, for example, on the Tokamak Fusion Test Reactor (TFTR) device. Instead they make use of a mixed (deuterium-tritium) NBI (MNBI) and thereby vastly reduce the cost and complexity of the fuel-recovery cycle. Another like consequence is the reduction of the total amount of tritium in the on-site inventory. The authors suspect that the alternative plant design would have a positive effect on safety, although they have not done an accident analysis based on the mixed-beam injectors. They have, however, studied the requirements of the new fuel cycle and have looked at the question of optimizing some of the parameters associated with a mixed-beam injector. 3 refs.

52554 Burn control studies for the International Thermonuclear Experimental Reactor. Mandrekas, J.; Stacey, W.M. *Transactions of the American Nuclear Society (USA)*, 59: 109-111 (1989). (CONF-890604--: Annual meeting of the American Nuclear Society, Atlanta, GA (USA), 4-8 Jun 1989).

The objective of the International Thermonuclear Experimental Reactor (ITER) is to demonstrate the scientific and technological feasibility of fusion power. In order to reach this objective, ITER would have to demonstrate controlled ignition and extended burn of deuterium-tritium (D-T) plasmas with steady state as an ultimate goal, as well as to validate design concepts and qualify engineering components that are essential to a reactor in an integrated system. It has long been known that tokamak reactors operating on the D-T cycle may be unstable against excursions in the particle temperature and density. This instability or thermal runaway is driven by the strong temperature dependence of the D-T reaction rate and can lead to disruptions due to violation of the beta limit or to operation in a regime incompatible with the engineering design of the reactor. Therefore, the identification and evaluation of different methods for burn control for ITER have been recognized recently to be as important an objective as any other major design requirement. Recent calculations for the compact ignition tokamak indicate that burn control via auxiliary power modulation is the most attractive method to be used in first-generation ignited fusion experiments. The purpose of this work is to evaluate auxiliary power modulation as a control mechanism for ITER.

52555 Impurity activation in magnet structural materials for fusion reactors. Zuchetti, M. *Transactions of the American Nuclear Society (USA)*, 59: 111-112 (1989). (CONF-890604--: Annual meeting of the American Nuclear Society, Atlanta, GA (USA), 4-8 Jun 1989).

Neutron-induced activity in fusion-reactor components can be effectively controlled through materials selection. This primarily applies to in-vessel components (first wall, blanket, etc.). However, some of the other machine components, such as the magnet coils, are also activated. In the Next European Torus (NET) project, for instance, activity in these components is high enough to require remote handling. The role of impurities in determining the activity in first-wall materials has already been investigated. In particular, it turns out that their medium- and long-term activity is remarkable affected by the presence of certain impurities. In order to satisfy currently proposed low-activity criteria, severe limitations have to be imposed on these impurities. In this paper, the authors examines the same problem in magnet structural materials. Specifically, the authors shall determine whether impurities can contribute a significant part of the activity in these materials. 5 refs., 2 tabs.

52556 An evaluation of brazes for plasma facing component applications from a waste disposal perspective. Parish, T.A. (Texas A & M Univ., College Station (USA)); Koski, J.A. *Transactions of the American Nuclear Society (USA)*, 59: 113-114 (1989). (CONF-890604--: Annual meeting of the American Nuclear Society, Atlanta, GA (USA), 4-8 Jun 1989).

Plasma facing components in fusion devices such as tokamaks must often sustain heat fluxes in the 2 to 40 MW/m^2 range. In this environment, it is essential that armor tiles be affixed to an actively cooled substrate with a minimum of thermal contact resistance. For divertor plates, limiters, beam dumps, and other high-heat-flux components used in fusion devices, low Z armor tiles, such as graphite, or high Z armor tiles, such as tungsten, are often brazed to cooled, highly conductive substrates, such as copper. The brazes that are typically 2 to 3 mils thick are chosen for certain characteristics, including (a) the ability to wet the materials to be joined, (b) braze time and temperature and consequent effects on material properties, and (c) metallurgical considerations, such as the potential formation of intermetallic alloys. The effect, or lack of effect, that the braze filler metal has on the granular structure of the metal substrate (copper) is also a consideration. Brazes will be needed in experimental fusion reactors in order to fasten armor tiles to substrates with minimal thermal contact resistance. Calculations of the activation products formed when candidate brazes are irradiated rule out the use of those containing significant amounts of silver or palladium according to current low-level-waste disposal limits. Some of the brazes that are most promising from a waste-disposal perspective have rather small engineering data bases on which to predicate their performance and may have less advantageous metallurgical characteristics. Investigations are continuing to identify promising armor tile-braze-substrate combinations. 3 refs., 1 tab.

52557 Performance of internally sealed IRF antennas in CCT. Taylor, R.J. (University of California at Los Angeles, Los Angeles, CA (USA)); Brown, M.L.; Lai, K.F.; Liberati, J.R. *AIP Conference Proceedings (American Institute of Physics) (USA)*, 190(1): 358-361 (1 Jul 1989). DOE Contract FG03-86ER53225. (CONF-8905120--: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

The internally sealed ICRF antennas in CCT no longer show impurity problems in the steady state or in the pulsed mode. Experience over a 6 month period indicates a minimum of one order of magnitude reduction in impurity generation for comparable input power (50 kW) used in previous experiments. The antenna radiation resistances agree with computer calculation within experimental error. In the Fast Wave Current Drive regime cavity resonances are absent. The power transfer to the plasma is nearly ideal. It is now clear that the power goes to the ions at the edge, where confinement is poor. The absorption mechanism is not understood. Wave penetration to the center is only possible for extremely low ($<10^{12} cm^3$) densities.

52558 The TFTR ICRF antenna-power feed and phase control of two mutually coupled antenna elements. Wilson, J.R. (Princeton Plasma Physics Laboratory, Princeton University, Princeton, NJ (USA)); Colestock, P.L.; Greene, G.J.; Hosea, J.C.; Phillips, C.K.; Stevens, J.E.; Hoffman, D.J.; Gardner, W.L. *AIP Conference Proceedings (American Institute of Physics) (USA)*, 190(1): 370-373 (1 Jul 1989). DOE Contract AC02-76CH03073. (CONF-8905120--: 8. topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989).

A transmission line model for the TFTR ICRF antenna is presented. The antenna is considered as being composed of mutually coupled transmission lines. Expressions for the input impedance of such a structure are given. Details of the considerations in setting up the antenna feed structure are presented. The requirement of dual feed drive coupled with the desire for phase and amplitude control place restrictions on the operating circuit.

52559 On the use of atmospheric pressure plasmas as electromagnetic reflectors and absorbers. Vidmar, R.J. (SRI International, Menlo Park, CA (US)). *IEEE Transactions on Plasma Science (Institute of Electrical and Electronics Engineers) (USA)*, 18(4): 733-741 (Aug 1990).

Tenuous plasmas in the earth's atmosphere from sea level to 100 km can be modeled as a cold collisional plasma. If an ionization process results in an electron density profile, such as an Epstein profile, that decreases from a maximum as a function of distance, then the plasma can either reflect or absorb electromagnetic waves, depending on the plasma characteristics. A high reflection coefficient requires a grazing angle of incidence, a low momentum-transfer collision rate, a high plasma density, and a short free-space-to-plasma transition relative to a wavelength. High absorption from VHF through X-band requires a high collision rate, a low plasma density, and a plasma transition of approximately

one wavelength. Both extremes are discussed. Typical collision rates and plasma lifetimes at atmospheric pressure are quantified.

A management and planning system has been developed for use in plant turnarounds, based on an analysis of 30 years of experience with major and minor turnaround activities. The basic concepts included in the resulting procedures used in turnaround organization and execution are outlined. These concepts include the generation of work lists prior to the turnaround start date, a review of the responsibilities of the planning group prior to and after the turnaround work list review meeting, the gathering of information needed prior to developing the turnaround schedule, development of the turnaround schedule, and the turnaround itself. The concepts were adapted to a computerized planning system called CASP (Computer Assisted Shutdown Planning) which is a specialized, portable, microcomputer-based tool that efficiently assigns to each item of site equipment involved in a turnaround of any site: manpower, tools, materials, and required permits at the activity or job step level. The CASP system is based on detailed critical path networking techniques and uses the discrete equipment item as its major key. It allows grouping of tasks that logistically belong together in separate networks, thus dividing the turnaround into a number of mini-turnarounds. Features of CASP include a generic equipment library containing typical work plans for various types and sizes of process equipment, capability to analyze various options, and provision of reports and cost estimates. CASP is in use at refineries, petrochemcial plants, and gas plants with benefits such as reduction in turnaround planning effort, reduced turnaround duration, and improved utilization of manpower, material, and resources.

52563 (EUR–12385) **Institute for transuranium elements Karlsruhe Annual Report 1988.** Commission of the European Communities, Luxembourg (Luxembourg). 1989. 239p. (TUAR–88). Source: NTIS (US Sales Only), PC A11/MF A01.

The present report summarizes the results of the work which has been performed in 1988 at the Institute for Transuranium Elements of the Joint Research Centre of the Commission of the European Communities. While, as in the past, major efforts were devoted to the Programme on Nuclear Fuels and Actinide Research, important contributions were made to other JRC Specific Programmes, i.e. Reactor Safety, Radioactive Waste Management, and Safeguards and Fissile Materials Control. In addition, The Institute has carried out analytical work for the EURATOM Safeguards Directorate and executed research tasks in the safeguards context, both, for the Commission of the European Communities and for the International Atomic Energy Agency in Vienna. Exploratory Research, finally, dealt with an investigation of possibilities of acoustic aerosol scavenging.

52565 (AD-A–223436/7/XAB) **Gamma data-base machine project. Technical report.** DeWitt, D.J.; Ghandeharizadeh, S.; Schneider, D.; Bricker, A.; Hsiao, H. Wisconsin Univ., Madison, WI (USA). Dept. of Computer Sciences. Mar 1990. 37p. Contract N00039-86-C-0578, Grant NSF-DCR85-12862. (TR–921). Source: NTIS, PC A03/MF A01.

This paper describes the design of the Gamma database machine and the techniques employed in its implementation. Gamma is a relational database machine currently operating on an Intel iPSC/2 hypercube with 32 processors and 32 disk drives. Gamma employs three key technical ideas which enable the architecture to be scaled to 100s of processors. First, all relations are horizontally partitioned across multiple disk drives enabling relations to be scanned in parallel. Second, novel parallel algorithms based on hashing are used to implement the complex relational operators such as join and aggregate functions. Third, dataflow scheduling techniques are used to coordinate multioperator queries. By using these techniques it is possible to control the execution of very complex queries with minimal coordination - a necessity for configurations involving a very large number of processors. In addition to describing the design of Gamma software, a thorough performance evaluation of the iPSC/2 hypercube version of Gamma is also presented. In addition to measuring the effect of relation size and indices on the response time for selection, join, aggregation, and update queries, we also analyze the performance of Gamma relative to the number of processors employed when the sizes of the input relations are kept constant (speedup) and when the sizes results obtained for both selection and join queries are linear; thus, doubling the number of processors halves the response time for a query.

52566 (AD-A–223479/7/XAB) **Parallel architectures and algorithms for image understanding. Final technical report, 1 November 1988-30 September 1989.** Nevatia, R.; Prasanna-Kumar, V.K. University of Southern California. Los Angeles, CA

(USA). Inst. for Robotics and Intelligent Systems. 17 May 1990. 45p. Grant AFOSR-89-0032. Source: NTIS, PC A03/MF A01.

Availability: Document partially illegible.

Several issues in using parallel processing for image understanding are addressed. First, efficient schemes for parallel image array access are developed. New class of latin squares called perfect latin squares are defined. Several construction methods are shown and some useful properties of such squares are identified. A generic parallel model of computation employing electro optical devices is developed. Parallel techniques for image computations are developed on this model. Finally, processor time optimal solutions to several low and intermediate level image understanding tasks are designed on orthogonal access parallel architectures.

52567 (AD-A-223578/6/XAB) **Innovative uses of parallel computers. Final report, 1 November 1988-31 October 1989.** Vichniac, G.; Molvig, K. Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center. 1 May 1990. 4p. Grant AFOSR-89-0119. Source: NTIS, PC A01/MF A01.

One of the significant discoveries that was made was primarily supported by the ONR and involves the development and extensive simulations of an original model that demonstrates the viability of the lattice-gas approach to hydrodynamics. The model overcomes major difficulties of the previous discrete approaches. These difficulties can be traced to discretization artifacts that introduce a violation of the Galilean invariance and spurious energy terms in the equation of state. (CP)

52568 (AD-A-223754/3/XAB) **Asynchronous design for parallel processing architectures. Semi-annual report, January-June 1990.** Meng, T.H. Stanford Univ., CA (USA). Jun 1990. 3p. Contract N00014-89-J-3036. Source: NTIS, PC A01/MF A01.

The objective of this research is to provide an interconnect design synthesis methodology which facilitates a modular design approach without compromising the global performance. The main tasks of this effort will be the development of the theory for optimal interconnect synthesis from a high-level specification, with emphasis on testability and fault-tolerance asynchronous interface among concurrent computing hardware objects, and the application of this design methodology to physical implementations of parallel processing systems.

52569 (AD-A-223806/1/XAB) **Path planning and obstacle avoidance hybrid system using a connectionist network. (Final report). Master's thesis.** Schuster, C.E. Rice Univ., Houston, TX (USA). Jun 1990. 146p. Source: NTIS, PC A07/MF A01.

Automated path planning and obstacle avoidance has been the subject of intensive research in recent times. Most efforts in the field of semiautonomous mobile-robotic navigation involve using Artificial Intelligence search algorithms on a structured environment to achieve either good or optimal paths. Other approaches, such as incorporating Artificial Neural Networks, have also been explored. By implementing a hybrid system using the parallel-processing features of connectionist networks and simple localized search techniques, good paths can be generated using only low-level environmental sensory data. This system can negotiate structured two- and three-dimensional grid environments, from a start position to a goal, while avoiding all obstacles. Major advantages of this method are that solution paths are good in a global sense and path planning can be accomplished in real time if the system is implemented in customized parallel-processing hardware. This system has been proven effective in solving two- and three-dimensional maze-type environments.

52570 (AD-A-223812/9/XAB) **MUSE - a systolic array for adaptive nulling with 64 degrees of freedom, using Givens transformations and wafer-scale integration. Technical report.** Rader, C.M.; Allen, D.L.; gLASCO , D.B.; Woodward, C.E. Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab. 18 May 1990. 82p. Contract F19628-90-C-0002. (TR-886). Source: NTIS, PC A05/MF A01.

This report describes an architecture for a highly parallel system of computational processors specialized for real-time adaptive antenna nulling computations with many degrees of freedom, which we call MUSE (Matrix Update Systolic Experiment), and a specific realization of MUSE for 64 degrees of freedom. Each processor uses the CORDIC algorithm and has been designed as a single integrated circuit. Ninety-six such processors working together can update the 64-element nulling weights based on 300 new observations in only 6.7 milliseconds. This is equivalent to 2.88 Giga-ops for a conventional processor. The computations are accurate enough to support 50 decibel of signal-to-noise improvement in a sidelobe canceller. The connectivity between processors is quite simple and permits MUSE to be realized on a single large wafer, using restructurable VLSI (Very Large Scale Integration). The complete design of such a wafer is described.

52571 (ANL-87-26-Vol.3, pp. 1-9) **Oscillation of superlinear matrix differential equations.** Ahlbrandt, C.D. (Univ. of Missouri, Columbia (USA)); Ridenhour, J.; Thompson, R.C. Argonne National Lab., IL (USA). Apr 1989. In *Proceedings of the focused research program on spectral theory and boundary value problems: Volume 3, Linear differential equations and systems.* 153p. Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

The main theorems extend to matrix differential equations Atkinson's classic theorem giving necessary and sufficient conditions for the oscillation of superlinear second-order scalar differential equations. The theorems improve recent results of Kura and of Butler and Erbe by removing the very restrictive hypothesis that solutions be symmetric. 21 refs.

52572 (ANL-87-26-Vol.3, pp. 11-19) **Spectral analysis of second order boundary problems with indefinite weight functions.** Allegretto, W. (Univ. of Alberta, Edmonton (Canada)). Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

The author studies the qualitative behavior of solutions and the spectrum of boundary problems of the form $Au = \lambda Bu$, where A is an ordinary/partial differential operator and B is a multiplication operator by a generally (sign) indefinite weight function. 13 refs.

52573 (ANL-87-26-Vol.3, pp. 21-38) **On the numerical computation of eigenvalues of Sturm-Liouville problems with matrix coefficients.** Atkinson, F.V. (Univ. of Toronto, Ontario (Canada)); Krall, A.M.; Leaf, G.K.; Zettl, A. Argonne National Lab., IL (USA). Apr 1989. In *Proceedings of the focused research program on spectral theory and boundary value problems: Volume 3, Linear differential equations and systems.* 153p. Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

The authors describe a method for the numerical computation of the eigenvalues of Sturm-Liouville differential equations with matrix function coefficients. The numerical procedure is based on unitary matrices constructed from the original S-L problem and the monitoring of the eigenvalues of these associated unitary matrices on the unit circle $w_j(x,\lambda)$, $a \le x \le b$. The algorithm uses a search procedure based on tracking these eigenvalues. The search procedure, described below, relies entirely on the behavior of the angles of certain points $w_j(b,\lambda)$ on the unit circle as functions of λ only. As functions of λ these move around the unit circle in a counterclockwise direction as λ increases. These angles are functions of both x and λ. For most problems these points on the unit circle also move counterclockwise as x increases from the left end point a to the right end point b of the basic interval. However, in some problems these points move counterclockwise as x increases through values in a subinterval of [a,b]. It may be these problems that cause the procedure to miss some eigenvalues. In the near future, the authors plan to alter the search algorithm by monitoring the behavior of these certain points on the unit circle in the complex plane as functions of both x and λ. In this way they hope to overcome the above-mentioned problem of missing eigenvalues in certain circumstances. The difficulty encountered can be illustrated in the scalar case. It can occur in situations when the Prufer angle $\Theta(x,\lambda)$, for fixed λ, decreases (rather than increases) as a function of x on part or all of the basic interval [a,b]. A significant feature of the algorithm is the fact that it computes the eigenvalues $\lambda_1 \le \lambda_2 \le \lambda_3 \le \ldots$ in order counting multiplicity. 2 refs., 3 figs., 4 tabs.

52574 (ANL-87-26-Vol.3, pp. 39-48) **Sufficient conditions for weighted sum interpolation inequalities in R^n.** Brown, R.C.

(Univ. of Alabama, Tuscaloosa (USA)); Hinton, D.B. Argonne National Lab., IL (USA). Apr 1989. In *Proceedings of the focused research program on spectral theory and boundary value problems: Volume 3, Linear differential equations and systems.* 153p. Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

Weighted sum inequalities are established for functions defined on a domain in R^n which are contained in an appropriate weighted Sobolev space. The inequalities establish a bound for the integral of the j-th derivative in terms of the integrals of the function of the m-th derivative for $j < m$. The weights in the three integrals are allowed to be different as well as the indices defining the norm. 11 refs.

52575 (ANL–87-26-Vol.3, pp. 49-67) **Asymptotic linearity of solutions of second-order systems of differential equations.** Chen, Shaozhu (Shandong Univ. (China)). Argonne National Lab., IL (USA). Apr 1989. In *Proceedings of the focused research program on spectral theory and boundary value problems: Volume 3, Linear differential equations and systems.* 153p. Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

The author considers the n-dimensional system $U'' + p(t)U = 0$, where p is an $n \times n$ Hermitian matrix-valued function. Necessary and/or sufficient conditions for all solutions to be asymptotic, in varying degrees, to linear matrix functions $tB + A$ are obtained. Systems with linear or nonlinear perturbations are also discussed. 14 refs.

52576 (ANL–87-26-Vol.3, pp. 69-76) **Oscillation theory for systems of second-order differential equations.** Erbe, L.H. (Univ. of Alberta, Edmonton (Canada)); Ganta, L. Argonne National Lab., IL (USA). Apr 1989. In *Proceedings of the focused research program on spectral theory and boundary value problems: Volume 3, Linear differential equations and systems.* 153p. Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

The authors obtain some oscillation criteria for the second order differential system $Y'' + Q(t)Y = 0$, where Q,Y are $n \times n$ real matrix-valued functions defined on $[a, +\infty]$ with $Q = Q(t)$ symmetric. 11 refs.

52577 (ANL–87-26-Vol.3, pp. 77-101) **A user's guide to subroutine SPDNSF [Spectral Density Function].** Fulton, C.T. (Florida Institute of Technology, Melbourne (USA)); Pruess, S.A. Argonne National Lab., IL (USA). Apr 1989. In *Proceedings of the focused research program on spectral theory and boundary value problems: Volume 3, Linear differential equations and systems.* 153p. Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

Subroutine SPDNSF (for Spectral Density Function) computes an approximation to the singular spectral function for Sturm-Liouville problems having continuous spectrum over $(0,\infty)$. The approximation is calculated by computing a large number of eigenvalues and norms of eigenfunctions (thousands) over [a,b] for large b and computing the associated step spectral function at a user-selected set of λ-points. The convergence of the step spectral function to the singular spectral function is known to be uniform on compact subsets of the continuous spectrum, a result that is supported by the numerical evidence. The code is restricted to the equation $-u'' + qu = \lambda u$ and written for a type of Sturm-Liouville problem involving liner dependence on λ in the boundary condition at the left endpoint. The code makes use of asymptotic formulas for the large eigenvalues and a shooting algorithm of S. Pruess for the smaller eigenvalues. 6 refs., 3 tabs.

52578 (ANL–87-26-Vol.3, pp. 103-111) **L^2-norm inequalities for the differentiation operator on compact intervals.** Gillman, D.W. (Argonne National Laboratory, IL (USA)); Kaper, H.G.; Kwong, Man Kam. Argonne National Lab., IL (USA). Apr 1989. In *Proceedings of the focused research program on spectral theory and boundary value problems: Volume 3, Linear differential equations and systems.* 153p. Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

In this article the authors establish the best possible value of the constant K in the inequality $\| f' \|^2 \leq K \| f \| \| f'' \|$ for functions f that are defined and twice continuously differentiable on a compact interval $[a,b] \subset R$ and whose first derivative vanishes at some point in [a,b]. 3 refs.

52579 (ANL–87-26-Vol.3, pp. 113-126) **High-order asymptotic approximations to the eigenvalues of Sturm-Liouville problems.** Harris, B.J. (Northern Illinois Univ., DeKalb (USA)). Argonne National Lab., IL (USA). Apr 1989. In *Proceedings of the focused research program on spectral theory and boundary value problems: Volume 3, Linear differential equations and systems.* 153p. Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

The author considers the eigenvalue problem $(py')' + qy = \lambda wy$ $-\infty < a \leq b < \infty$, $y(a) \sin \alpha - p(a)y'(a) \cos \alpha = 0$, $y(b) \cos \beta + p(b)y'(b) \sin \beta = 0$ for $\alpha, \beta \in [0,\pi]$. He drives estimates of the eigenvalues, λ_n, of the form $\lambda_n = \phi(n) + 0(n^{-k})$, where the constant k increases with the smoothness of p,q and w. 9 refs.

52580 (ANL–87-26-Vol.3, pp. 127-134) **Landau's inequality for the difference operator.** Kwong, Man Kam (Argonne National Laboratory, IL (USA)); Zettl, A. Argonne National Lab., IL (USA). Apr 1989. In *Proceedings of the focused research program on spectral theory and boundary value problems: Volume 3, Linear differential equations and systems.* 153p. Order Number DE89011499. Source: NTIS, PC A08/MF A01 - OSTI.

The best constants for Landau's inequality with the classical p-norms are known explicitly only when $p = 1$, 2, and ∞. This is true for both the discrete and the continuous versions of the inequality and for both the whole line and half line cases. In each of the six known cases the best constant for the discrete version is the same as the best constant for the continuous version. Here the authors show that for many other values of p the discrete constants are strictly greater than the corresponding continuous ones. In addition, they show that the three norm version of the inequality, established by Nirenberg and Gabushin in the continuous case, is also valid in the discrete case. 8 refs.

This paper discusses: discontinuities and adaptive computation; chaotic flows; oil reservoir simulation; and parallel computation.

52584 (JAERI-M–90-100) **Visualization of computed results.** Tsuruoka, Takuya (Nuclear Energy Data Center, Tokai, Ibaraki (Japan)); Ishiguro, Misako. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1990. 53p. (In Japanese). Order Number DE91713043. Source: NTIS (US Sales Only), PC A04/MF A01.

Visualization of computed results has become an indispensable means to get better understanding of physical phenomena. In this circumstances, a trial of visualization has started at JAERI in 1989.

The examples, tried so far, are animations of three kinds of physical phenomena: heat flow behavior in a curved pipe, transient behavior of molten metals heated by electron beam in laser isotope separation process, and Xenon-induced oscillation behavior in the core of the high temperature gas-cooled test reactor. Each animated graph is recorded on a video tape of several minutes. Three-dimensional color graphics software FACOM CGMS, which runs on FACOM VP or M-780 systems, has been used for this purpose. This report describes the visualization methods used for these graphic applications. (author).

52585 (JAERI-M–90-108) **Vectorization of DOT3.5 code: DOT3.5 NEA version, DOT3.5 FNS version, DOT3.5 FER version, RADHEAT-V4, DOT-DD.** Nonomiya, Iwao (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ishiguro, Misako; Tsutsui, Tsuneo. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1990. 85p. (In Japanese). Order Number DE91713056. Source: NTIS (US Sales Only), PC A05/MF A01.

In this report, we describe the vectorization of two-dimensional Sn-method radiation transport code DOT3.5. Vectorized codes are not only the NEA original version developed at ORNL but also the versions improved by JAERI: DOT3.5 FNS version for fusion neutronics analyses, DOT3.5 FER version for fusion reactor design, and ESPRIT module of RADHEAT-V4 code system for radiation shielding and radiation transport analyses. In DOT3.5, input/output processing time amounts to a great part of the elapsed time when a large number of energy groups and/or a large number of spatial mesh points are used in the calculated problem. Therefore, an improvement has been made for the speedup of input/output processing in the DOT3.5 FNS version, and DOT-DD (Double Differential cross section) code. The total speedup ratio of vectorized version to the original scalar one is 1.7≈1.9 for DOT3.5 NEA version, 2.2≈2.3 fro DOT3.5 FNS version, 1.7 for DOT3.5 FER version, and 3.1≈4.4 for RADHEAT-V4, respectively. The elapsed times for improved DOT3.5 FNS version and DOT-DD are reduced to 50≈65% that of the original version by the input/output speedup. In this report, we describe summary of codes, the techniques used for the vectorization and input/output speedup, verification of computed results, and speedup effect. (author).

52586 (JAERI-M–90-114) **Quality control of the software in the JT-60 computer control system.** Isaji, Nobuaki (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Kurihara, Kenichi; Kimura, Toyoaki. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1990. 32p. (In Japanese). Order Number DE91713057. Source: NTIS (US Sales Only), PC A03/MF A01.

The JT-60 Control System should be improved corresponding to the experimental requirements. In order to keep the integrity of the system even in the modification the concept of quality control (QC) was introduced in the software development. What we have done for QC activity are (1) to establish standard procedures of the software development, (2) to develop support tools for grasping the present status of the program structure, and (3) to develop a document system, and a source program management system. This paper reports these QC activities and their problems for the JT-60 control system. (author).

52587 (LA-UR–90-3145) **Managing computer security: How can research help?.** Bailey, D.J. Los Alamos National Lab., NM (USA). [1990]. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-9010195–1: ESORICS '90, Toulouse (France), 24-26 Oct 1990). Order Number DE91000230. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper points out significant problems in managing the security of large systems. Addressed to the research community, it suggests research questions whose solution would benefit the people charged with protecting actual systems, and, hence, would create real improvements in system security. The problems of managing connection-rich distributed systems are discussed, and a research direction leading to a solution for the problems of distributed systems is suggested.

52588 (LBL–26455, pp. 76) **Exact solution of a periodic-cluster Hubbard model with an electron-lattice interaction.** Proetto, C.R.; Falicov, L.M. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

An exact solution of a modified Hubbard model for a tetrahedral cluster with periodic boundary conditions is presented. It includes a static electron-lattice interaction in which the intersite bond-hopping parameter is a function of the bond electron occupation. It is found that the intrasite Coulomb repulsion and the effective attractive electron-lattice interaction have, generally speaking, opposite (although not identical) effects. They cancel each other exactly along a line of singularities in parameter space. The state vectors are easily obtained analytically. A study is made of magnetic and super-conducting static correlation functions as functions of the parameters. Various forms of anisotropic superconducting fluctuations are favored in the various regimes. There is an indication of possible states with coexisting nonuniform, nonisotropic superconductivity and antiferromagnetism caused by a compromise between the competing forces.

52589 (LBL–26455, pp. 77) **Heavy-fermion system: Superconducting and magnetic fluctuations within a periodic-Cluster Hubbard model.** Reich, A.; Falicov, L.M. Lawrence Berkeley Lab., CA (USA). Jul 1989. In *Materials and Chemical Sciences Division annual report, 1988.* 236p. Order Number DE90003301. Source: NTIS, PC A11/MF A01.

An exact solution of an eight-site crystal model with periodic boundary conditions, a small face-centered-cubic crystal, is presented for the case of a heavy-fermion system. The model consists of (a) a single, fully symmetric orbital per site, with nearest-neighbor and second-nearest-neighbor hopping; (b) an infinite Coulomb repulsion between electrons on the same site; (c) antiferromagnetic superexchange interactions; and (d) band fillings near half filling (six, seven, and eight electrons per cluster). The superconducting and the antiferromagnetic correlations are studied and compared with the predictions of the noninteracting limit. The suitability of Bardeen-Cooper-Schrieffer and Gutzwiller approximate ground-state wave functions are quantitatively estimated.

52590 (LBL–29301) **The practical computer in design.** Schuman, J.; Ward, G. Lawrence Berkeley Lab., CA (USA). Jul 1990. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-9008156–1: 5. ICSRIC-90: international conference on systems research, informatics and cybernetics, Baden-Baden (German Democratic Republic), 6-12 Aug 1990). Order Number DE91000353. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Electronic information processing is becoming a necessity in today's complex design environment, but what is an appropriate role for the computer in the design process? Computation should be applied throughout all design phases, but practicing designers today rarely use computers beyond simple word processing and drafting tasks. While many design tasks are poorly matched to the computer, other pragmatic and productive avenues remain unexploited. We discuss the need to recognize which elements of the design process are most suited to computer assistance. The authors define a role for the computer as an objective assistant to the designer, and discuss practical approaches in two application areas for computers in design: design simulation and resource information management.

52591 (LUSG-WP–528) **Software for energy modelling: a theoretical basis for improvements in the user interface.** Siu, Y.L. Leeds Univ. (UK). School of Geography. Sep 1989. 44p. Source: Available from School of Geography, University of Leeds, Leeds LS2 9JT.

A philosophical critique of the relationships between theory, knowledge and practice for a range of existing energy modelling styles is presented. In particular, Habermas's ideas are invoked regarding the three spheres of cognitive interest (i.e. technical, practical and emancipatory) and three levels of understanding of knowledge, the construction of an 'ideal speech situation', and the theory of communicative competence and action. These are adopted as a basis for revealing shortcomings of a representative selection of existing computer-based energy modelling styles, and

as a springboard for constructing a new theoretical approach. (author).

52592 (ORAU–89/C-140, pp. 21-35) **Man-machine communication for symbiotic control.** Sheridan, T.B. (Massachusetts Institute of Technology, Cambridge (USA)). Oak Ridge National Lab., TN (USA); Oak Ridge Associated Universities, Inc., TN (USA). 1989. (CESAR–89/19;CONF-881281–: Workshop on human-machine symbiotic systems, Oak Ridge, TN (USA), 5-6 Dec 1988). In *1988 workshop on human-machine symbiotic systems proceedings.* 196p. Order Number DE89013888. Source: NTIS, PC A09/MF A01.

As telerobotic and other systems are asked to do more sophisticated tasks, the communication between man and machine becomes more critical. This paper specifies communication functions and forms both of human and computer, discusses telerobotic control activities about which communication is essential in relation to the human's metal model and the computer's internal model, gives examples of critical research areas in man-machine communication, and suggests appropriate performance measures. 15 refs., 5 figs., 2 tabs.

(Georgia Institute of Technology, Atlanta (USA)). Oak Ridge National Lab., TN (USA); Oak Ridge Associated Universities, Inc., TN (USA). 1989. (CESAR–89/19;CONF-881281–: Workshop on human-machine symbiotic systems, Oak Ridge, TN (USA), 5-6 Dec 1988). In *1988 workshop on human-machine symbiotic systems proceedings.* 196p. Order Number DE89013888. Source: NTIS, PC A09/MF A01.

As computer technology becomes both more sophisticated and more affordable, design issues become more challenging. In complex, dynamic systems, computers can be used to replace human decision makers, to enhance decision making via decision aiding, or to amplify human potential by providing the human operator an associate or assistant in the decision making process. In complex systems, uncertainty associated with system dynamics and the costs and risks associated with system malfunction make the first option, replacement of the human decision maker with a computer decision maker, an unrealistic alternative. Recent research has shown that display enhancement is a design alternative that has proved successful in reducing operator workload and increasing operator effectiveness. This paper describes research that examines the feasibility and effectiveness of the third alternative-design teams of decision makers that include both humans and computers. This design strategy is sometimes called an operator's associate. The function of an associate is to provide intelligent assistance for the human operator of a complex dynamic system. The basis for intelligent, context-sensitive advice and reminders is the ability of the associate to infer likely operator intentions in real time. Such human-computer architectures draw heavily on artificial intelligence models. This paper discusses the general requirements for an operator's associate and presents an overview of three components of an on-going research project: (OFMspert Operator Function Model expert system), a particular architecture of an intelligent operator's associate; ACTIN, OFMspert's intent-inferencing mechanism; and Ally, an implementation of OFMspert with system control functions. 23 refs., 11 figs., 2 tabs.

52594 (ORAU–89/C-140, pp. 145-147) **Breakout session: Human-machine communication.** Beckerman, M. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA); Oak Ridge Associated Universities, Inc., TN (USA). 1989. (CESAR–89/19;CONF-881281–: Workshop on human-machine symbiotic systems, Oak Ridge, TN (USA), 5-6 Dec 1988). In *1988 workshop on human-machine symbiotic systems proceedings.* 196p. Order Number DE89013888. Source: NTIS, PC A09/MF A01.

The participants' interests in human-machine symbiotic systems were varied, ranging from the design of systems for handicapped individuals such as quadriplegics to the building of near-earth satellite operator's associates for NASA to robotics for handling nuclear power plant accidents. At the conclusion of the session, the group on Human-Machine Communication observed that there are two immediate, promising areas of research into communications in human-machine symbiotic systems. These high priority areas are: (1) The simultaneous (concurrent) and integrated use of multiple modalities, or sensor channels, for communication between man and machine and (2) the development of models of the human operator within intelligent computer systems, with emphasis on characteristics present during periods of both nominal and unusual arousal and stress. 1 fig.

52595 (ORAU–89/C-140, pp. 129-141) **Toward a learning robot.** Mitchell, T.M. (Carnegie-Mellon Univ., Pittsburgh, PA (USA)); Mason, M.T.; Christiansen, A.D. Oak Ridge National Lab., TN (USA); Oak Ridge Associated Universities, Inc., TN (USA). 1989. (CESAR–89/19;CONF-881281–: Workshop on human-machine symbiotic systems, Oak Ridge, TN (USA), 5-6 Dec 1988). In *1988 workshop on human-machine symbiotic systems proceedings.* 196p. Order Number DE89013888. Source: NTIS, PC A09/MF A01.

The problem of robot manipulation-of planning how to successfully grasp, push, and pull arbitrary objects to reconfigure them as desired-is an unsolved problem in robotics. A hand-eye system is presently being developed which is intended to begin with simple knowledge about how to manipulate its world, and to itself acquire increasingly refined knowledge about manipulation in specialized contexts. For example, the robot may begin with knowledge such as to move an object somewhere to the right, push from some point on the left, and may refine the knowledge through experience into more specific, more precise assertions such as to move object which is in contact with a wall to the right in a straight line, push from a point on the left which is 2/3 of the distance from the wall. The learning method is a type of explanation-based generalization driven by an incomplete theory of the domain-in particular by a theory for qualitative differential analysis. This paper presents an approach to constructing a planning/learning system of this kind, and is primarily organized around a hand-generated example of the type of behavior our system is intended to exhibit. 10 refs., 5 figs.

52596 (ORAU–89/C-140, pp. 149-151) **Breakout session: Autonomous task planning and execution monitoring.** Mann, R.C. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA); Oak Ridge Associated Universities, Inc., TN (USA). 1989. (CESAR–89/19;CONF-881281–: Workshop on human-machine symbiotic systems, Oak Ridge, TN (USA), 5-6 Dec 1988). In *1988 workshop on human-machine symbiotic systems proceedings.* 196p. Order Number DE89013888. Source: NTIS, PC A09/MF A01.

The discussion in this session focused on mainly two areas: (1) interpretations of the scope of and rationale for human-machine symbiosis and (2) issues involved in autonomous task planning. Symbiosis can be viewed as an approach to bridge the gap between the majority of robotic systems today that are capable of performing complex tasks under full teleoperation or after being preprogrammed and those few prototype systems capable of autonomous behavior for simple assignments. The issue in symbiosis is not autonomy versus teleoperation but a dynamic mixture of both modes of robot operation. It was pointed out that the concepts considered in symbiosis do not apply only to human-robot systems. An example presented was the interaction between a human and an intelligent data base system through a computer work station. In any event, autonomy is a prerequisite for symbiosis. Furthermore, the group maintained that autonomy is not synonymous to intelligence. Task planning refers to the decomposition of a symbolic goal description into a sequence of tasks with associated numeric descriptions that can be executed by the different agents in the symbiotic system. Prerequisites for task planning include an appropriate goal description; models for the current environment and agents and other resources available to the system, as well as adequate definitions of possible constraints under which the goal must be achieved, e.g., limited. time. 2 figs.

52597 (ORAU–89/C-140, pp. 153-156) **Breakout session: Dynamic task allocation.** Manges, W. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA); Oak Ridge Associated Universities, Inc., TN (USA). 1989. (CESAR–89/19;CONF-881281–: Workshop on human-machine symbiotic systems, Oak Ridge, TN (USA), 5-6 Dec 1988). In *1988 workshop on human-machine symbiotic systems proceedings.* 196p. Order Number DE89013888. Source: NTIS, PC A09/MF A01.

The group began by developing a list of the attributes of the best approaches to dynamic task allocation. The resulting list included such factors as timeliness, coherence, load balance, and risk. Subsequent discussion detailed the importance of various architectural, human interface, and measurement issues in designing a human-machine symbiotic system that optimizes the allocation attributes for the current application. The group concluded by emphasizing the importance of on-line observers and other intelligent mechanisms to dynamically assess the progress and directedness of the agents of the dynamic task allocation implementation in achieving the defined tasks. Topics recommended for further research included improved measurements, architectures, relative human-machine roles, and task granularity.

52598 (ORAU–89/C-140, pp. 157-161) **Breakout session: Human-machine system architecture.** DePiero, F.W. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA); Oak Ridge Associated Universities, Inc., TN (USA). 1989. (CESAR–89/19;CONF-881281–: Workshop on human-machine symbiotic systems, Oak Ridge, TN (USA), 5-6 Dec 1988). In *1988 workshop on human-machine symbiotic systems proceedings.* 196p. Order Number DE89013888. Source: NTIS, PC A09/MF A01.

This session of the workshop focused on the subject of human-machine symbiotic (H-MS) system architecture. The session began with an agreement on the definition of an architecture. Two examples were discussed, and then, to focus the discussion, the following question was considered; Is there a canonical human-machine symbiotic system architecture, or are there only good design rules? This question provoked many suggestions of what a good architecture might be. It became clear that a set of criteria was needed to evaluate the merits of an architecture. Throughout the session many areas of potential research were also identified. 2 figs.

52599 (ORAU–89/C-140, pp. 163-170) **Breakout session: Machine learning via experience and human observation.** Spelt, P.K. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA); Oak Ridge Associated Universities, Inc., TN (USA). 1989. (CESAR–89/19;CONF-881281–: Workshop on human-machine symbiotic systems, Oak Ridge, TN (USA), 5-6 Dec 1988). In *1988 workshop on human-machine symbiotic systems proceedings.* 196p. Order Number DE89013888. Source: NTIS, PC A09/MF A01.

Considerable time and effort were spent to define the terms Learning and Symbiosis in the Human-Machine Symbiosis context. While the original question for the group was not directly answered, the issues railed by the 5 questions presented below should serve as areas of focus for research on human-machine symbiosis in the next few years. The utility of both inductive, data-driven learning systems and deductive, knowledge-driven systems was highlighted, and there was some suggestion that a blending of the two approaches would be good. The 5 questions are: 1. What role should learning play in a Machine and Human symbiotic relationship? 2. Can learning improve system performance as opposed to improved machine performance with overall lowered system performance? 3. What is learnable? What kinds of subtasks could the machine learn, and what must (should) remain with the human? 4. Should the Human always be in control, or are there times when it is permissible for the machine to be in control? 5. When is Machine Leaning useful? 1 fig.

52600 (ORNL/TM–11661) **Adapting sensory data for multiple robots performing spill cleanup.** Storjohann, K.; Saltzen, E. Oak Ridge National Lab., TN (USA). Sep 1990. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE91000689. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper describes a possible method of converting a single performing robot algorithm into a multiple performing robot algorithm without the need to modify previously written codes. The algorithm to be converted involves spill detection and clean up by the HERMIES-III mobile robot. In order to achieve the goal of multiple performing robots with this algorithm, two steps are taken. First, the task is formally divided into two sub-tasks, spill detection and spill clean-up, the former of which is allocated to the added performing robot, HERMIES-IIB. Second, a inverse perspective mapping, is applied to the data acquired by the new performing robot (HERMIES-IIB), allowing the data to be processed by the previously written algorithm without re-writing the code. 6 refs., 4 figs.

52601 (PB–90-254012/XAB) **Annotated bibliography on parallel parsing.** op den Akker, R.; Alblas, H.; Nijholt, A.; Luttighuis, P.O. Technische Univ. Twente, Enschede (Netherlands). Dept. of Computer Science. Dec 1989. 39p. (MEMO-INF–89-67). Source: NTIS, PC A03/MF A01.

The annotated bibliography on parallel parsing and recognition of context-free languages covers most of the important publications in this fast growing area of computer science and natural language processing. The list of publications is preluded by an introduction which presents an overview of the field.

52602 (PB–90-237387/XAB) **Supercomputer simulation of ITO stochastic differential equations. Phase 1.** Petersen, W.P. Principia Supervectus, Inc., Seattle, WA (USA). 16 Sep 1987. 69p. Grant NSF-ISI8660377. Source: NTIS, PC A04/MF A01.

It was the intent of the project to improve the methods for simulating stochastic differential equations, both in terms of optimizing computer codes for execution time and improving the accuracy of determining functionals of the simulated process. By appropriate modifications of the existing theory about stability in numerical methods for ordinary differential equations, researchers found encouraging results for stochastic differential equations. They concluded that sample sizes and stability are far more important than the step size for obtaining satisfactory results. The methods are well adapted for vector or parallel computers. Examining vector/parallel computing methods for such processes inspires new methods for generating uniform and gaussian random numbers and produces a new and welcome attitude change about such simulations.

52603 (PNL-SA–17937) **Efficient iteration in data-parallel programs with irregular and dynamically distributed data structures.** Littlefield, R.J. Pacific Northwest Lab., Richland, WA (USA). Feb 1990. 15p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Grant CCR-8619663;Grant CCR-9807666. (CONF-900874–4: 1990 international conference on parallel processing, St. Charles, IL (USA), 13-17 Aug 1990). Order Number DE91000417. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

To implement an efficient data-parallel program on a non-shared memory MIMD multicomputer, data and computations must be properly partitioned to achieve good load balance and locality of reference. Programs with irregular data reference patterns often require irregular partitions. Although good partitions may be easy to determine, they can be difficult or impossible to implement in programming languages that provide only regular data distributions, such as blocked or cyclic arrays. We are developing Onyx, a programming system that provides a shared memory model of distributed data structures and extends the concept of data distribution to include irregular and dynamic distributions. This provides a powerful means to specify irregular partitions. Perhaps surprisingly, programs using it can also execute efficiently. In this paper, we describe and evaluate the Onyx implementation of a model problem that repeatedly executes an irregular but fixed data reference pattern. On an NCUBE hypercube, the speed of the Onyx implementation is comparable to that of carefully handwritten message-passing code.

52604 (PNL-SA–18372) **Proceedings of the CEC/USDOE workshop on uncertainty analysis.** Elderkin, C.E. (Pacific Northwest Lab., Richland, WA (USA)); Kelly, G.N. (eds.). Pacific Northwest Lab., Richland, WA (USA). Sep 1990. 78p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (EUR–13044-EN;CONF-8911195–: CEC/USDOE workshop on uncertainty analysis, Santa Fe, NM (USA), 13-16 Nov 1989). Order Number DE91000454. Source: NTIS, PC A05/MF A01 - OSTI; GPO Dep.

In recent years it has become increasingly important to specify the uncertainty inherent in consequence assessments and in the models that trace radionuclides from their source, through the environment, to their impacts on human health. European and US scientists have, been independently developing and applying methods for analyzing uncertainty. It recently became apparent that a

scientific exchange on this subject would be beneficial as improvements are sought and as uncertainty methods find broader application. The Commission of the European Communities (CEC) and the Office of Health and Environmental Research of the US Department of Energy (OHER/DOE), through their continuing agreement for cooperation, decided to co-sponsor the CEC/USDOE Workshop on Uncertainty Analysis. CEC's Radiation Protection Research Programme and OHER's Atmospheric Studies in Complex Terrain Program collaborated in planning and organizing the workshop, which was held in Santa Fe, New Mexico, on November 13 through 16, 1989. As the workshop progressed, the perspectives of individual participants, each with their particular background and interests in some segment of consequence assessment and its uncertainties, contributed to a broader view of how uncertainties are introduced and handled. This proceedings contains, first, the editors' introduction to the problem of uncertainty analysis and their general summary and conclusions. These are then followed by the results of the working groups, and the abstracts of individual presentations.

52605 (SAND–90-0416) **Finite element error estimation and adaptivity based on projected stresses.** Jung, J. Sandia National Labs., Albuquerque, NM (USA). Aug 1990. 73p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE91000483. Source: NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report investigates the behavior of a family of finite element error estimators based on projected stresses, i.e., continuous stresses that are a least squared error fit to the conventional Gauss point stresses. An error estimate based on element force equilibrium appears to be quite effective. Examples of adaptive mesh refinement for a one-dimensional problem are presented. Plans for two-dimensional adaptivity are discussed. 12 refs., 82 figs.

52606 (SAND–90-1813C) **Living with Omniback and the 8mm drive.** Jones, M.C. Sandia National Labs., Albuquerque, NM (USA). [1990]. 21p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9009259–1: Apollo domain users' society workstation conference, San Diego, CA (USA), 30 Sep - 4 oct 1990). Order Number DE91000022. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Apollo's OmniBack backup system provides a convenient and effective way of storing network backup information on 8mm tape. In addition it has a journaling facility to write extensive log files, recording the backup process in almost any degree of detail desired. The directory structure and file names used are logical and well-defined. Summary files announce the degree of success of the backup as specified in the work file. The system will run unattended under the UNIX cron command, allowing the backup to be performed during the night when user demands on the network are small and most user files are free.

52607 (UCID–21566) **INGRID by example: A pictorial tutorial.** Rainsberger, R. Lawrence Livermore National Lab., CA (USA). Nov 1988. 117p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE91000481. Source: NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The following examples of INGRID input files and results are from various sources including Doug Stillman. In many cases, they are the same as in the examples section of the INGRID manual by Doug Stillman. I have made some modest improvements so that they are all complete input files to be run with the latest version of INGRID. These files have been attached to the front end of the INGRID source as comments. I wish to invite all INGRID user's to submit any favorite input files to be included in this tutorial. Such an input file should not be too large, and the object being generated should have a natural appeal to INGRID users. Feel free to make suggestions. This tutorial will soon replace the examples section of the manual. The entire manual will be replaced a section at a time. I chose to do this section first, since it could give the most benefit in the shortest amount of time. As soon as I make INGRID interactive, I will then rewrite the section on standard parts.

52608 (USGS-OFR–89-139) **FREQFIT: Computer program which performs numerical regression and statistical chi-squared goodness of fit analysis.** Hofland, G.S.; Barton, C.C. Geological Survey, Denver, CO (USA). 1990. 62p. Sponsored by U.S. DOE Radioactive Waste Management; U.S. Geological Survey. DOE Contract AI08-78ET44802. Order Number DE91000133. Source: NTIS, PC A04/MF A01; OSTI; INIS; US Geological Survey, Books and Open-File Reports Section, Box 25425 Federal Center, Denver CO 80225; GPO Dep.

The computer program FREQFIT is designed to perform regression and statistical chi-squared goodness of fit analysis on one-dimensional or two-dimensional data. The program features an interactive user dialogue, numerous help messages, an option for screen or line printer output, and the flexibility to use practically any commercially available graphics package to create plots of the program's results. FREQFIT is written in Microsoft QuickBASIC, for IBM-PC compatible computers. A listing of the QuickBASIC source code for the FREQFIT program, a user manual, and sample input data, output, and plots are included. 6 refs., 1 fig.

52609 **Efficient bit-level, word-level, and block-level systolic arrays for matrix-matrix multiplication.** DeGroot, A.J. (Lawrence Livermore National Lab., Livermore, CA (US)); Parker, S.R.; Johansson, E.M. pp. 107-115 of High speed computing: Volume 880. Casasent, D.P. Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (USA) (1988). pp. 224 (CONF-8801146–: High speed computing meeting, Los Angeles, CA (USA), 11-12 Jan 1988).

This paper investigates the mapping of matrix-matrix multiplication onto bit level, word level and block level systolic arrays. Highly efficient and regular bit level, word level and block level systolic arrays are described. Efficiencies of many block level and word level systolic arrays reported in this paper approach 100%, three times the efficiencies of systolic arrays reported previously. Bit level systolic arrays reported in this paper require less computation time than do bit level systolic arrays reported previously and, for special matrices, require less cells. Execution times of block level systolic algorithms on a sixty-four-element multiprocessor agree with theory.

"New Releases" is Energy Information Administration's news letter, which reports its activities, publications, and machine-readable data files and modeling programs. For each publication or report, an abstract, subscription price, availability, and other bibliographical information are included. It covers crude oil, natural gas, and natural gas liquids reserves, coal, electricity, nuclear fuel, renewable energy and conservation, and petroleum. Order forms are also provided.

52611 (DOE/ER/75527–2) **Design, develop, test, and implement an on-line research and education information service: Technical status report, September 30, 1989–September 30, 1990.** Federal Information Exchange, Inc., Germantown, MD (USA). [1990]. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-89ER75527. Order Number DE90017654. Source: NTIS, PC A02/MF A01 - OSTI; GPO Dep.

On September 30, 1989, Federal Information Exchange, Inc. received a grant from the Department of Energy (DOE) to operate the DOEINFO system, convert it to the FEDIX system, enlarge its scope to include programs at Argonne, Brookhaven, Lawrence Berkeley, Oak Ridge and Pacific Northwest Laboratories and add the National Aeronautics and Space Administration (NASA) and the Office of Naval Research (ONR) to the system. FEDIX has been developed to give DOE, ONR, and NASA maximum editorial control over the content of the information provided on-line. Procedures have been developed to ensure maximum consultation

between Agency staff and Federal Information Exchange, Inc. The key features that have made FEDIX attractive to the user community include: ease of use, no service charge, quality information, search by keywords, download capacity comprehensive information, and participation of several agencies. The objective and milestones outlined in the FEDIX proposal are on schedule and work requirements have been met. During the next six months all proposed work will be accomplished.

52612 (LBL-PUB–3081) **TOOLKIT, Version 2.0.** Schroeder, E.; Bagot, B.; McNeill, R.L. Lawrence Berkeley Lab., CA (USA). 9 May 1990. 38p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE91000378. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The purpose of this User's Guide is to show by example many of the features of Toolkit II. Some examples will be copies of screens as they appear while running the Toolkit. Other examples will show what the user should enter in various situations; in these instances, what the computer asserts will be in boldface and what the user responds will be in regular type. The User's Guide is divided into four sections. The first section, "FOCUS Databases", will give a broad overview of the Focus administrative databases that are available on the VAX; easy-to-use reports are available for most of them in the Toolkit. The second section, "Getting Started", will cover the steps necessary to log onto the Computer Center VAX cluster and how to start Focus and the Toolkit. The third section, "Using the Toolkit", will discuss some of the features in the Toolkit – the available reports and how to access them, as well as some utilities. The fourth section, "Helpful Hints", will cover some useful facts about the VAX and Focus as well as some of the more common problems that can occur. The Toolkit is not set in concrete but is continually being revised and improved. If you have any opinions as to changes that you would like to see made to the Toolkit or new features that you would like included, please let us know. Since we do try to respond to the needs of the user and make periodic improvement to the Toolkit, this User's Guide may not correspond exactly to what is available in the computer. In general, changes are made to provide new options or features; rarely is an existing feature deleted.

52613 (ORNL/TM–11627) **A conceptual design for a graphics output interface for the Worldwide Household Goods Information System for Transportation Modernization (WHIST-MOD).** Loftis, J. (Oak Ridge National Lab., TN (USA)); James, T. Oak Ridge National Lab., TN (USA). Aug 1990. 23p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. Order Number DE90018036. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Directorate of Personal Property of the Military Traffic Management Command (MTMC) requested that Oak Ridge National Laboratory (ORNL) design and prototype a decision support system, the Worldwide Household Goods Information System for Transportation Modernization (WHIST-MOD). This decision support system will automate current tasks and provide analysis tools for evaluating the Personal Property Program, predicting impacts to the program, and planning modifications to the program to meet the evolving needs of military service members and the transportation industry. The system designed by ORNL consists of three application modules: system dictionary applications, data acquisition and administration applications, and user applications. The development of the user applications module is divided into two phases. Round 1 is the data selection front-end interface, and Round 2 is the output or back-end interface. This report describes the conceptual design for the back-end output interface of the user applications module, which will be prototyped using SAS, a data management and statistical analysis toolset. This report discusses our goals for the back-end interface and describes how we plan to meet these goals. Our design fulfills the users' needs for a flexible interface that can be used to produce a variety of tabular and graphical output. 4 figs.

52614 (SAND–89-0738) **WhiteStar user's guide.** Ezell, T.F. Sandia National Labs., Albuquerque, NM (USA). Aug 1990. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE91000094. Source: NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The WhiteStar project provides design engineers with needed part design data. WhiteStar encourages the use of preferred parts by providing a user-convenient parts database. This report shows selections the user makes in order to obtain information on a particular part. 15 figs.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in *DOE Energy Data Base: Corporate Author Entries* (DOE/TIC-4585). Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, also abbreviated; and (3) the language of the document if non-English (R;US;In French). Author affiliations are not listed in this index.

Coal surface control for advanced fine coal flotation: Annual report, October 1, 1988–December 31, 1989, 15:50259 (R;US)
Coal surface control for advanced fine coal flotation: Quarterly report No. 7, April 1, 1990–June 30, 1990, 15:50260 (R;US)

California Univ., Berkeley, CA (USA). Dept. of Chemical Engineering
A dual-gas tracer technique for determining trapped gas saturation during steady foam flow in porous media, 15:50450 (R;US)

California Univ., Berkeley, CA (USA). Dept. of Nuclear Engineering
An approximate method for analyzing transient condensation on spray in HYLIFE-II, 15:52530 (R;US)
The pressure relaxation of liquid jets after isochoric heating, 15:52531 (R;US)

California Univ., Riverside, CA (USA)
[Catalytic mechanism of hydrogenase from aerobic N_2-fixing microorganisms]: Progress report, 15:51775 (R;US)

California Univ., Riverside, CA (USA). Dept. of Chemistry
Spectroscopic study of coal structure and reactivity: Quarterly report, September 15, 1989–December 14, 1989, 15:50307 (R;US)
Spectroscopic study of coal structure and reactivity: Quarterly report, December 15, 1989–March 14, 1990, 15:50308 (R;US)

California Univ., Riverside, CA (USA). Statewide Air Pollution Research Center
Lifetimes and fates of toxic air contaminants in California's atmosphere. Final report, 15:51662 (R;US)

California Univ., San Diego, CA (USA)
Development of models for use in the assessment of waste repository performance: Annual progress report, November 1, 1988–September 30, 1989, 15:50614 (R;US)

California Univ., San Francisco, CA (USA). Lung Biology Center
Effects of acid fog on airway function in people with asthma. Final report, 15:51869 (R;US)

California Univ., Santa Barbara, CA (USA)
High-performance brittle matrices and brittle-matrix composites. Book 1. Final report, 15 March 1986-30 September 1989, 15:51117 (R;US)
High-performance brittle matrices and brittle-matrix composites. Book 2. Final report, 15 March 1986-30 September 1989, 15:51118 (R;US)

Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada)
Development of an economic large-scale growth medium for Rhizopus arrhizus, a uranium-adsorbing fungus. Final report, 15:51092 (R;CA)
The Summerside Project: An AFBC [atmospheric fluidization-bed combustion] boiler for high-sulphur coal and wood chips, 15:50361 (R;CA)

Canada Library of Parliament, Ottawa, ON (Canada). Research Branch
Acid rain, 15:51007 (R;CA)

Canada Mortgage and Housing Corp., Ottawa, ON (Canada)
LeBreton Flats district heating: Institutional issues: Demonstration report, 15:50993 (R;CA)

Canadian Coast Guard, Ottawa, ON (Canada)
Marine oil pollution response, 15:50485 (R;CA)

Canadian Heavy Oil Association (Canada)
Heavy oil production and the environment, 15:50522 (R;CA)
Canadian Petroleum Association, Calgary, AB (Canada)
A report on enhancements for existing and future helicopters supporting operations of the Canadian oil and gas industry, 15:50456 (R;CA)
Canadian Pulp and Paper Association, Montreal, PQ (Canada). Technical Section
Marine ichthyoplankton data from the Canadian Beaufort Sea Shelf, July and September 1984, 15:51730 (R;CA)
Canadian Seabed Research Ltd., Halifax, NS (Canada)
Environmental code of practice for treatment and disposal of waste discharges from offshore oil and gas operations, 15:50483 (R;CA)
Canadian Society for Civil Engineering, Montreal, PQ (Canada)
Annual conference and the 9th Canadian hydrotechnical conference: Volume 2A and 2B. Proceedings, 15:50680 (R;CA)
Carlson and Fink Associates, Inc., Fairfax, VA (USA)
Bulk system reliability screening analysis. Final report, 15:50902 (R;US)
Case Western Reserve Univ., Cleveland, OH (USA)
Doped cerium oxide for molten carbonate fuel cell cathodes: Final report, 15:51034 (R;US)
CBY Associates, Inc., Washington, DC (USA)
Central solar heating plants with seasonal storage: Final report on IEA Task 7, 15:50731 (R;US)
CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Genie Radioactif
New strategy for minor actinides partitioning preliminary results on the electrovolatilization of ruthenium and on the stabilization of Am(IV) in nitric acid with phosphotunsgstate ligand, 15:50550 (R;FR)
Results and prospects for some actinide extractants usable in actinide partitioning, 15:50551 (R;FR)
Central Research Inst. of Electric Power Industry, Tokyo (Japan)
Development of technology for plantlet propagation by tissue culture. 1.: Effect of plant hormones on strawberry callus formation and their regeneration, 15:51844 (R;JP;In Japanese)
Centre d'Etudes et Recherches des Charbonnages de France (CERCHAR), 92 - Rueil-Malmaison (France)
New drilling techniques, 15:50346 (R;XE;In French)
Studies of the processes of coal utilisation and conversion, 15:50291 (R;XE;In French)
Centre de Pyrolyse de Marienau, 57 (France)
Post-cracking of volatile matter from coal carbonization, 15:50289 (R;XE;In French)
Centre de Recherches Metallurgiques, Liege (Belgium)
Study of the transitory stages of the coking process, 15:50287 (R;XE;In French)
Centro Sviluppo Materiali SpA, Rome (Italy)
Influence of charge density on coking in a wide chamber oven, 15:50288 (R;XE;In Italian)
Centrum voor Energiebesparing en Schone Technologie, Delft (Netherlands)
Deersum energy project: Demonstration Project: Final report, 15:50751 (R;LU)
Chapman Petroleum Engineering Ltd., Calgary, AB (Canada)
Reserve and economic evaluation. Oil and gas properties, 15:50394 (R;CA)
Chemical Research, Development and Engineering Center, Aberdeen Proving Ground, MD (USA)
Determination of room vapor concentration from liquid chemical agent spill using GW-BASIC. Final report, August 1987-February 1990, 15:51639 (R;US)
Coast Guard, Groton, CT (USA). Marine Fire and Safety Research Div.
Suppression methods for deep-seated coal fires. Final report, 15:50354 (R;US)
Colorado State Univ., Fort Collins, CO (USA)
Analysis of loss mechanisms in polycrystalline thin film solar cells: Final subcontract report, April 1, 1988–March 31, 1990, 15:50719 (R;US)
Colorado Univ., Boulder, CO (USA)
Novel thin-film $CuInSe_2$ fabrication: Final subcontract report, 15:50720 (R;US)
[Spectroscopic diagnostics of electron-atom collisions: Progress report], 15:51953 (R;US)
[The role of natural organic matter in the partitioning and transport of polynuclear aromatic hydrocarbons in groundwater]: Progress report, 15:51728 (R;US)
Columbia Univ., New York, NY (USA)
Coal surface control for advanced fine coal flotation: Annual report, October 1, 1988–December 31, 1989, 15:50259 (R;US)
Coal surface control for advanced fine coal flotation: Quarterly report No. 7, April 1, 1990–June 30, 1990, 15:50260 (R;US)
Commission of the European Communities, Brussels (Belgium). Directorate General for Employment, Social Affairs and Education
Technical and physical parameters for quality assurance in medical diagnostic radiology: Tolerances, limiting values and appropriate measuring methods, 15:51790 (R;GB)

L

Lawrence Berkeley Lab., CA (USA)
A study of chromium carbide precipitation at interphase boundaries in stainless steel welds, 15:51137 (R;US)
A study of the chemical, mechanical, and surface properties of thin films of hydrogenated amorphous carbon, 15:51252 (R;US)
A survey of synchrotron radiation devices producing circular or variable polarization, 15:51551 (R;US)
Acoustic emission in a fluid saturated heterogeneous porous layer with application to hydraulic fracture, 15:51886 (R;US)
An improved operating mode for a Si(Li) x-ray spectrometer, 15:51586 (R;US)
Concept for an experiment on particle and jet production at midrapidity, 15:52024 (R;US)
Current and potential distributions on a cylinder electrode, 15:52345 (R;US)
Development of a calibration method for quantitative x-ray powder diffraction of size-segregated aerosols, 15:51294 (R;US)
First-order kinetics-controlled multiple species reactive transport of dissolved organic compounds in groundwater: Development and application of a numerical model, 15:51704 (R;US)
From comfort to kilowatts: An integrated assessment of electricity conservation in Thailand's commercial sector, 15:51066 (R;US)
From comfort to kilowatts: An integrated assessment of electricity conservation in Thailand's commercial sector: Volume 2: Technical appendix, 15:51067 (R;US)
Heavy quark production at SLC and LEP, 15:52063 (R;US)
High-resolution results from the LBL 55-meter SGM [Spherical Grating Monochromator] at SSRL [Stanford Synchrotron Radiation Laboratory] near the K-edge of carbon and nitrogen, 15:51605 (R;US)
Magnetic and optical properties of Np and Pu ions and compounds, 15:51253 (R;US)
Mirrors as power filters, 15:51550 (R;US)
New techniques for particle accelerators: Extended abstract, 15:51498 (R;US)
Order, chaos and nuclear dynamics: An introduction, 15:52223 (R;US)
Research on the metallurgical determinants of formability in electrogalvanized sheet, 15:51135 (R;US)
Textural characterization and its applications on zinc electrogalvanized steels, 15:51136 (R;US)
The LBL 55-meter spherical grating monochromator at SSRL [Stanford Synchrotron Radiation Laboratory], 15:51549 (R;US)
The meson spectrum between 1 and 2 GeV: Gluonic states and other exotica, 15:52023 (R;US)
The practical computer in design, 15:52590 (R;US)
The use of wet limestone systems for combined removal of SO_2 and NO_x from flue gas, 15:50773 (R;US)
Thermal energy storage for cooling of commercial buildings, 15:51065 (R;US)
TOOLKIT, Version 2.0, 15:52612 (R;US)
Transuranium elements: A half century, 15:52167 (R;US)
Transverse beam dynamics studies of a heavy ion induction linac, 15:51515 (R;US)

Lawrence Livermore National Lab., CA (USA)
A 250-GHz CARM [Cyclotron Auto Resonance Maser] oscillator experiment driven by an induction linac, 15:51501 (R;US)
A chemical kinetic modeling study of chlorinated hydrocarbon combustion, 15:51376 (R;US)
A comparison of mechanical properties and scaling law relationships for silica aerogels and their organic counterparts, 15:51259 (R;US)
A conceptual design of the International Thermonuclear Experimental Reactor for the Central Solenoid, 15:52535 (R;US)
A fuel pellet injector for the Microwave Tokamak Experiment (MTX), 15:52533 (R;US)
A high temperature, plasma-assisted chemical vapor deposition system, 15:52299 (R;US)
A model for the prediction of Nb_3Sn critical current as a function of field, temperature, strain, and radiation damage, 15:52528 (R;US)
A molecular dynamics model of the orthogonal cutting process, 15:51143 (R;US)
An approximate method for analyzing transient condensation on spray in HYLIFE-II, 15:52530 (R;US)
An updated summary of MATHEW/ADPIC model evaluation studies, 15:51683 (R;US)
Application of linear magnetic loss model of ferrite to induction cavity simulation, 15:51525 (R;US)
Bragg crystal polarimeter for the Spectrum-X-Gamma mission, 15:51926 (R;US)
Calculation of soft x-ray lasers at 44.8Å and 43.1Å, 15:51451 (R;US)
Computations of quenching and stability in a CICC [cable-in-conduit conductor] conductor, 15:51449 (R;US)
Design and operation of the electron beam ion trap, 15:51965 (R;US)
Design of a neutron penumbral-aperture microscope with 10-μm resolution, 15:52534 (R;US)
Design of long induction linacs, 15:51500 (R;US)
Development of models for use in the assessment of waste repository performance: Annual progress report, November 1, 1988–September 30, 1989, 15:50614 (R;US)
Dispersion and interbunch energy variation for an E^+E^- linear collider, 15:51522 (R;US)
ECH by FEL and gyrotron sources on the Microwave Tokamak Experiment (MTX) tokamak, 15:52544 (R;US)
Energy and technology review, July–August, 1990, 15:50990 (R;US)
Energy sweep compensation of induction accelerators, 15:51560 (R;US)
Fabrication development for high-level nuclear waste containers for the tuff repository: Phase 1 final report, 15:50613 (R;US)
FENIX [Fusion ENgineering International eXperimental]: A test facility for ITER [International Thermonuclear Experimental Reactor] and other new superconducting magnets, 15:52536 (R;US)
Fusion energy: Progress in the design of the international thermonuclear experimental reactor (ITER), 15:52545 (R;US)
Grazing incidence metal mirrors as the final elements in a laser driver for inertial confinement fusion, 15:52539 (R;US)
High current ignitor development, 15:51448 (R;US)
HYLIFE-2 inertial confinement fusion reactor design, 15:52538 (R;US)
INGRID by example: A pictorial tutorial, 15:52607 (R;US)
J/ψ suppression: Catching up with the comovers, 15:52170 (R;US)
K-shell and L-shell plasma spectroscopy experiments: Final technical report, 15:51964 (R;US)
Laser driven instabilities in inertial confinement fusion, 15:52529 (R;US)
Measurement and simulation of whole beam brightness on the ETA-II [Experimental Test Accelerator-II] linear induction accelerator, 15:51521 (R;US)
Microwave excitation of copper vapor plasmas: Final report, 15:50648 (R;US)
Mild coal gasification screw pyrolyzer development and design, 15:50295 (R;US)
Multiple Group Analysis (MGA): A gamma-ray spectrum analysis code for determining plutonium isotopic abundances: Volume 2, A guide to using MGA, 15:51373 (R;US)
Needs for experiment and theory in intermediate energy reactions, 15:52225 (R;US)
Novel plasma-based frequency upshift methods for short pulse lasers, 15:51450 (R;US)

Order-disorder phenomena in complex alloys: The case of A15-based substitutional alloys, 15:51142 (R;US)
Oscillating liquid flow ICF [inertial confinement fusion] reactor, 15:52540 (R;US)
Parametric cost analysis of a HYLIFE-II power plant, 15:52537 (R;US)
Particle distributions in collisionless magnetic reconnection: An implicit Particle-In-Cell (PIC) description, 15:52543 (R;US)
Photoconductivity of activated carbon fibers, 15:51258 (R;US)
Potential for collaboration on the Superconducting Super Collider, 15:51490 (R;US)
Pressure and impulse scaling methods for wall impact in ICF [inertial confinement fusion], 15:52532 (R;US)
Processing parameters and kinetics of bromination and chlorination in the $YBa_2Cu_3O_{6+x}$ system, 15:51196 (R;US)
Progress in ETA-II magnetic field alignment using stretched wire and low energy electron beam techniques, 15:51558 (R;US)
Reactive sputtering of molybdenum-oxide gradient-index filters, 15:51195 (R;US)
Reduction of beam corkscrew motion on the ETAII linear induction accelerator, 15:51520 (R;US)
Relativistic klystrons for high-gradient accelerators, 15:51559 (R;US)
REMAP: A computer code that transfers node information between dissimilar grids, 15:52350 (R;US)
Shock compaction of high-T_c superconductors, 15:51197 (R;US)
Simulation and theory of radial equilibrium of plasmoid propagation: Final report, 15:52007 (R;US)
Some applications of mirror-generated electric potentials to alternative fusion concepts, 15:52542 (R;US)
Test results of a prototype dielectric microcalorimeter, 15:51594 (R;US)
The cascade ICF reactor with an x-ray and debris shield and a heavy-ion driver, 15:52541 (R;US)
The heat transport system and plant design for the HYLIFE-2 fusion reactor, 15:52546 (R;US)
The pressure relaxation of liquid jets after isochoric heating, 15:52531 (R;US)
Theoretical/numerical investigation of induction cavity impedances for moderate to large gap widths, 15:51524 (R;US)
TOPAZ2D heat transfer code users manual and thermal property data base, 15:52351 (R;US)
US DOE-AECL cooperative program for development of high-level radioactive waste container fabrication, closure, and inspection techniques, 15:50615 (R;US)
Uses of Fabry-Perot velocimeters in studies of high explosives detonation, 15:51632 (R;US)
Using traveling wave structures to extract power from relativistic klystrons, 15:51561 (R;US)
Wake potentials and impedances for the ATA [Advanced Test Accelerator] induction cell, 15:51523 (R;US)
White Paper Panel No. 5 performance evaluation, 15:50645 (R;US)
X-ray microcalorimeters with germanium resistance thermometers, 15:51593 (R;US)
[Technique for determining the static polarizabilities of refractory metal atoms]: Final report, 15:50549 (R;US)

Leeds Univ. (UK). School of Geography
Software for energy modelling: a theoretical basis for improvements in the user interface, 15:52591 (R;GB)

Lehigh Univ., Bethlehem, PA (USA). Dept. of Chemistry
Chemical characterization of the surface sites of coal: Technical progress report, July–September 1989, 15:50310 (R;US)
Chemical characterization of the surface sites of coal: Technical progress report, October–December 1989, 15:50311 (R;US)

Los Alamos National Lab., NM (USA)
50 kA, 50 kV DC international and switching systems for the Los Alamos ZTH experiment, 15:52510 (R;US)
A fluor and wire-shadow diagnostic for low-energy ion beams, 15:51509 (R;US)
A measurement of $\Delta\sigma_L$(np), the difference between neutron-proton total cross sections in pure longitudinal spin states, 15:52020 (R;US)
A three-dimensional tight-binding model for trans-polyacetylene, 15:52292 (R;US)
Accelerator-driven neutron sources for materials research, 15:52513 (R;US)
Advanced system analysis for indirect methanol fuel cell power plants for transportation applications, 15:51108 (R;US)
AFDM: An Advanced Fluid-Dynamics Model: Volume 2, Topologies, flow regimes, and interfacial areas, 15:51417 (R;US)
An evaluation of the geothermal potential of the Tecuamburro Volcano area of Guatemala, 15:50747 (R;US)
Angular dependence of thin-film dielectric coating damage thresholds, 15:52291 (R;US)
Antimatter gravity experiment, 15:52344 (R;US)
Application of a relational data base for documenting the Ground Test Accelerator cable routing and wiring interconnections, 15:51544 (R;US)
Application of plasma shield technology to the reduction, treatment, and disposal of hazardous organic and/or mixed wastes with actinide recovery, 15:50595 (R;US)
Applications of Maxent to quantum Monte Carlo, 15:52343 (R;US)
ASA arms control session 1990, 15:51115 (R;US)
Bayesian spectral analysis of reflectivity data, 15:52171 (R;US)
Beam dynamics design of a pion linac, 15:51510 (R;US)
Benchmark studies of the Bending Corrected Rotating Linear Model (BCRLM) reactive scattering code: Implications for accurate quantum calculations, 15:52342 (R;US)
Complete fluid equations for low-n singular modes in axisymmetric toroidal plasmas, 15:52370 (R;US)
Concepts in strong Langmuir turbulence theory, 15:52006 (R;US)
Continued studies of co-pumping of deuterium and helium on a single, 4K activated charcoal panel, 15:52511 (R;US)
Coupled radio-frequency quadrupoles as compensated structures, 15:51511 (R;US)
Detoxification of hazardous waste streams using microwave-assisted fluid-bed oxidation, 15:51375 (R;US)
General quadrupole shapes in the Interacting Boson Model, 15:52222 (R;US)
Guidance for the preparation of Safety Analysis Reports: Volume 2, Performing safety analyses, 15:51880 (R;US)
High ionization efficiency techniques for CW RIMS, 15:51290 (R;US)
High power linear accelerators for tritium production and transmutation of nuclear waste, 15:51496 (R;US)
High power rf amplifiers for accelerator applications: The large orbit gyrotron and the high current, space charge enhanced relativistic klystron, 15:51545 (R;US)
High resolution inelastic gamma-ray measurements with a white neutron source from 1 to 200 MeV, 15:52172 (R;US)
High-precision density measurements using tomography, 15:51421 (R;US)
Increasing output power of an 850 MHz tetrode with a floating-deck modulator, 15:51543 (R;US)
Influence of strain rate on the structure/property of Ti-48Al-1V, 15:51131 (R;US)
Intensity dependent Thomson scattering and harmonic generation from free electrons, 15:51959 (R;US)
Lasing on higher harmonics, 15:51492 (R;US)
Linear accelerator for production of tritium: Physics design challenges, 15:51494 (R;US)
Magnetic bunchers for the generation of high peak current, low emittance electron pulses at medium energy, 15:51514 (R;US)
Magnetic structures of actinide materials by pulsed neutron diffraction, 15:51130 (R;US)
Managing computer security: How can research help?, 15:52587 (R;US)
Measurement of RF surface efficiency at cryogenic temperatures using a resonant cavity, 15:51548 (R;US)
Measurement of the absolute cross section for multiphoton ionization of atomic hydrogen at 248 nm, 15:51960 (R;US)
Measurement uncertainty estimates for reprocessing facilities, 15:50553 (R;US)
Microwave properties of HTS [high temperature superconductor] films, 15:51187 (R;US)
Microwave sintering of nanocrystalline TiO_2, 15:51186 (R;US)
Modeling of the quasi-steady magnetotail, 15:51939 (R;US)
New beam facilities at LAMPF, 15:51497 (R;US)

Nonlinear pulsation masses, 15:51917 (R;US)
Parity and time-reversal symmetry nonconservation in neutron-nucleus interactions, 15:52203 (R;US)
Phenomenology of some rare and forbidden η-decays, 15:52021 (R;US)
Photoabsorption modulation in GaAs: $Ga_{1-x}In_x$ as strained-layer superlattices, 15:52290 (R;US)
Photoelectric injector designs at Los Alamos National Laboratory, 15:51546 (R;US)
Production of uniform and well-confined beams by nonlinear optics, 15:51513 (R;US)
Progress in photoinjectors for linacs, 15:51547 (R;US)
Radioactive targets for nuclear astrophysics research at LANSCE, 15:51918 (R;US)
Rare decays, 15:52022 (R;US)
Semi-analytical calculation of accelerating beam in a photoinjector cavity, 15:51508 (R;US)
Sigma Mesa: Background elemental concentrations in soil and vegetation, 1979, 15:51703 (R;US)
Special functions associated with SU(3) Wigner-Clebsch-Gordan coefficients, 15:52341 (R;US)
Summary of 1990 Code Conference, 15:51512 (R;US)
Target physics results at 248 nm wavelength from the Aurora laser system high-intensity campaign, 15:52508 (R;US)
The effect of surface roughness on the phase of neutrons specularly reflected at grazing incidence, 15:52233 (R;US)
The pros and cons of cryogenic accelerators: An engineering point of view, 15:51493 (R;US)
The reaction of vapor-deposited Al with Cu oxides, 15:51129 (R;US)
The use of a spreadsheet in the design of accelerator components, 15:51542 (R;US)
Thermodynamics and magnetism in $Th_xU_{1-x}Be_{13-y}B_y$, 15:51242 (R;US)
Three-dimensional simulations of harmonic radiation and harmonic lasing, 15:51495 (R;US)

Tritium experiments on components for fusion fuel processing at the Tritium Systems Test Assembly, 15:52512 (R;US)
Working with 36 CFR Part 79: Experience at Los Alamos National Laboratory, 15:50941 (R;US)
XUV free-electron laser-based projection lithography systems, 15:52289 (R;US)
ZT1: An ignition class reversed-field pinch, 15:52509 (R;US)

Louisiana Gasification Technology, Inc., Plaquemine, LA (USA)
Environmental monitoring plan for the Dow Syngas Project. Annual report, January 1-December 31, 1989, 15:50337 (R;US)

Louisiana State Univ., Baton Rouge, LA (USA). School of Geoscience
Environmental monitoring at designed geopressured-geothermal well sites, Louisiana and Texas: Quarterly status report, July, August, September 1990, 15:50749 (R;US)

Lund Univ. (Sweden). Dept. of Cosmic and Subatomic Physics
Angular correlations and fragmentation in intermediate energy heavy ion collisions, 15:51962 (R;SE)

Lund Univ. (Sweden). Dept. of Diagnostic Radiology
Diagnostic and interventional radiology in gynecologic neoplasms, 15:51824 (R;SE)

Lund Univ. (Sweden). Dept. of Nuclear Physics
The (γ, p) reaction in light nuclei at intermediate energies, 15:52174 (R;SE)

Lund Univ. (Sweden). Dept. of Radiation Physics
Development and evaluation of attenuation and scatter correction techniques for SPECT using the Monte Carlo method, 15:52234 (R;SE)

Lund Univ. (Sweden). Dept. of Theoretical Physics
Fractal structures and intermittency in QCD, 15:52065 (R;SE)
New results in quantum chromodynamics, 15:52064 (R;SE)

M

Management and Technical Systems, McMurray, PA (USA)
Air-Sparged Hydrocyclone/Advanced Froth Flotation fine coal cleaning: Final report, 15:50257 (R;US)

Manitoba Dept. of Energy and Mines, Winnipeg, MB (Canada)
Energy management course for building managers, 15:51101 (R;CA)

Manitoba Hydro, Winnipeg, MB (Canada)
Perspective 2000, 15:50911 (R;CA)

Manufacturing and Technology Conversion International, Inc., Columbia, MD (USA)
Production of low-cost hydrogen: Quarterly report, January–March 1990, 15:50657 (R;US)

Marburg Univ. (Germany, F.R.). Fachbereich 20 - Humanmedizin
Post-mortem radiography of the lungs: Experiments to compare various methods of examination and descriptions of their usefulness in actual practice, 15:51794 (R;DE;In German)

Marine Biological Lab., Woods Hole, MA (USA). Ecosystems Center
Leaf exsertion, leaf elongation, and leaf senescence in Eriophorum vaginatum and Carex Bigelowii: Final report, 15:51696 (R;US)

Martin Marietta Energy Systems, Inc., Piketon, OH (USA)
Proceedings of the 21PF-1 overpack conference, 15:50555 (R;US)

Maryland Univ., Baltimore, MD (USA). Dept. of Electrical Engineering
Pulse propagation in inhomogeneous optical fibers: Progress report, September 15, 1989–September 14, 1990, 15:52272 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Dept. of Electrical Engineering and Computer Science
Interaction of electromagnetic fields with chondrocytes in gel culture. Final report, February-August 1989, 15:51877 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center
Innovative uses of parallel computers. Final report, 1 November 1988-31 October 1989, 15:52567 (R;US)

Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab.
High-power hybrid two-dimensional surface-emitting AlGaAs diode laser arrays, 15:51436 (R;US)
Monolithic two-dimensional GaAs/AlGaAs laser arrays fabricated by chlorine ion-beam-assisted micromachining, 15:51435 (R;US)
MUSE - a systolic array for adaptive nulling with 64 degrees of freedom, using Givens transformations and wafer-scale integration. Technical report, 15:52570 (R;US)

Massachusetts Univ., Boston, MA (USA)
Magnetic resonance studies of photosynthetic reaction centers and porphyrins: Final report, June 1, 1987–November 15, 1989, 15:50714 (R;US)

Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik
Heavy quark charge asymmetries below the Z^0 resonance, 15:52025 (R;DE)
Prospects of CsJ(Tl)-photodiode detectors for low level spectroscopy, 15:51588 (R;DE)
Reinvestigation of compositeness limits from e^+e^- annihilation, 15:52066 (R;DE)

Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)
A statistical approach to plasma profile analysis, 15:52361 (R;DE)
Scalings and plasma profile parameterisation of ASDEX high density ohmic discharges, 15:52360 (R;DE)

McDaniel and Associates Consultants Ltd., Calgary, AB (Canada)
Evaluation of Canadian Angus Resources, 15:50475 (R;CA)

Memorial Univ. of Newfoundland, St. John's, NF (Canada). Centre for Cold Ocean Resources Engineering
Five year research plan, 1990-1994, 15:51736 (R;CA)

Mercy Hospital and Medical Center, Chicago, IL (USA)
Organizing and financing energy efficiency projects in public buildings: Proceedings of a seminar, 15:51068 (R;CA)

Metropolitan Water Reclamation District of Greater Chicago, IL (USA)
Effect of recycling thermophilic sludge on the activated-sludge process. Report for October 1984-June 1989, 15:51094 (R;US)

Miami Univ., FL (USA)
Magnetic multilayer interface anisotropy: Technical progress report, August 1, 1990–December 31, 1990, 15:51127 (R;US)

Michaud (L.), Inc., Montreal, PQ (Canada)
The impact of acidification on the economic value of recreational fishing in Quebec, 15:50954 (R;CA)
The impact of acidification on the economic value of recreational fishing in eastern Canada, 15:50942 (R;CA)

Michigan Univ., Ann Arbor, MI (USA)
Report on land-based sources of marine pollution in the Caribbean. Technical report, 15:51752 (R;US)

Michigan Univ., Ann Arbor, MI (USA). Coll. of Engineering
Microwave excitation of copper vapor plasmas: Final report, 15:50648 (R;US)

Michigan Univ., Ann Arbor, MI (USA). Dept. of Atmospheric, Oceanic and Space Science
Estimation of seasonal and annual acidic deposition through aggregation of three-day episodic periods. Report for February 1989-1991, 15:51661 (R;US)

Michigan Univ., Ann Arbor, MI (USA). Dept. of Electrical Engineering and Computer Science
High-current-density thermionic cathodes and the generation of high-voltage electron beams. Final technical report, 1 September 1982-30 April 1989, 15:51947 (R;US)

Midwest Research Inst., Kansas City, MO (USA)
Further studies of 60 Hz exposure effects on human function: Quarterly report No. 5, July 1, 1990–September 30, 1990, 15:50908 (R;US)

Minerals Management Service, Anchorage, AK (USA). Alaska Outer Continental Shelf Region
Beaufort Sea Planning Area oil and gas lease Sale 124: Final Environmental Impact Statement, 15:50488 (R;US)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, *International Energy: Subject Thesaurus* (ETDE/PUB-2). In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

A

A CODES
Comparison of observed and predicted KR-85 air concentrations, 15:51687 (BA;US)

A-BOMB SURVIVORS
An improved method for detecting genetic variation in DNA using denaturing gradient gel electrophoresis, 15:51842 (R;JP)
Organ doses to atomic bomb survivors from radiological examinations at the Radiation Effects Research Foundation, 15:52237 (R;JP)
Search for mutations altering protein charge and/or function in children of atomic bomb survivors: final report, 15:51857 (R;JP)
Spontaneous loss and alteration of antigen receptor expression in mature CD4+ T cells, 15:51858 (R;JP)

ABANDONED SITES
Analysis and evaluation of a radioactive waste package retrieved from the Farallon Islands 900-meter disposal site, 15:50562 (R;US)

ABNORMALITIES (CHROMOSOMAL)
See CHROMOSOMAL ABERRATIONS

AC SYSTEMS
Bimode uninterruptible power supply compatibility in renewable hybrid energy systems, 15:50992 (J;US)

ACCELERATOR FACILITIES
See also STANFORD LINEAR COLLIDER
[Stanford Linear Accelerator Center] annual environmental monitoring report, January–December 1989, 15:51681 (R;US)

ACCELERATORS
See also COLLECTIVE ACCELERATORS
HEAVY ION ACCELERATORS
LINEAR ACCELERATORS
New techniques for particle accelerators: Extended abstract, 15:51498 (R;US)
Particle accelerator employing transient space charge potentials, 15:51526 (P;US)

ACCELEROMETERS
Evaluation of uniaxial and triaxial shock isolation techniques for a piezoresistive accelerometer, 15:51616 (R;US)

ACCESS DENIAL SYSTEMS
See ENTRY CONTROL SYSTEMS

ACCIDENTAL INTAKE
See ACCIDENTS

ACCIDENTS
See also BLOWOUTS
REACTOR ACCIDENTS
A pilot program for introduction of (ARCHIE) Automated Resource for Chemical Hazard Incident Evaluation, 15:51644 (R;US)

ACES
See QUARKS

ACETONE
Metal-support effects on acetone hydrogenation over platinum catalysts, 15:50298 (J;US)

ACETYLENE
Bond strengths of ethylene and acetylene, 15:51342 (J;US)
Rate constants for the reactions $O + C_2H_2$ and $O + C_2D_2 \rightarrow$ products, over the temperature range ~850-1,950 K, by the flash photolysis-shock tube technique. Determination of the branching ratio and a further theoretical analysis, 15:51384 (J;US)
[Catalytic mechanism of hydrogenase from aerobic N_2-fixing microorganisms]: Progress report, 15:51775 (R;US)

ACID ELECTROLYTE FUEL CELLS
Corrosion in fuel cells: An overview, 15:51036 (BA;US)

ACID RAIN
Acid rain, 15:51007 (R;CA)
Development of a state-of-the-art acid-deposition model for the South Coast Air Basin of California. Final report, 15:51673 (R;US)
Effects of acid fog on airway function in people with asthma. Final report, 15:51869 (R;US)
Effects of acidity on the fish populations of the north Mauricie, 15:51871 (R;CA)
Estimation of seasonal and annual acidic deposition through aggregation of three-day episodic periods. Report for February 1989-1991, 15:51661 (R;US)
Representative Ralph Regula, 15:50336 (RA;US)
Research directors in DOE'S life science programs, 15:51801 (RA;US)
The effects of acid precipitations on wetlands, 15:51694 (R;CA)
[International conference on acidic deposition]: Foreign trip report, August 5, 1990–September 21, 1990, 15:51658 (R;US)

ACIDIFICATION
The impact of acidification on the economic value of recreational fishing in eastern Canada, 15:50942 (R;CA)

ACIDIZATION
Selective acid washing technique for improved oil production from the Youngstown Field in Alberta, 15:50424 (RA;CA)

ACOUSTIC EMISSION TESTING
Research of acoustic emissions in natual gas vehicle storage cylinders, 15:50521 (R;CA)

ACOUSTIC MEASUREMENTS
Annular array and method of manufacturing same, 15:51621 (P;US)

ACRALDEHYDE
See ACROLEIN

ACRIDINES
Effectiveness factors for hydroprocessing of coal and coal liquids: Progress report No. 11, March 16, 1990–June 15, 1990, 15:50269 (R;US)

ACROLEIN
Measurements of toxic exhaust emissions from gasoline-powered light-duty vehicles. Final report, 15:51674 (R;US)

ACRYLIC ALDEHYDE
See ACROLEIN

ACTINIDES
See also AMERICIUM
CURIUM
NEPTUNIUM
PLUTONIUM
THORIUM
URANIUM

Application of plasma shield technology to the reduction, treatment, and disposal of hazardous organic and/or mixed wastes with actinide recovery, 15:50595 (R;US)
Results and prospects for some actinide extractants usable in actinide partitioning, 15:50551 (R;FR)

ACTINIUM C
See BISMUTH 211

ACTIVATED CARBON
Photoconductivity of activated carbon fibers, 15:51258 (R;US)

ACTIVITY COEFFICIENT
See REACTION KINETICS

ADDITIVES
Laser desorption/photoionization time-of-flight mass spectrometry of polymer additives, 15:51283 (R;US)

ADENOCARCINOMAS
See CARCINOMAS

ADENOSINE TRIPHOSPHATASE
See ATP-ASE

AECL
See ATOMIC ENERGY OF CANADA LTD

AEROSOLS
See also SMOKES
A model for soot formation in a laminar diffusion flame, 15:51378 (J;US)
An intercomparison of measurements of aerosol elemental carbon during the 1986 carbonaceous species method comparison study, 15:51692 (J;US)
Development of a calibration method for quantitative x-ray powder diffraction of size-segregated aerosols, 15:51294 (R;US)

AIR
See also SURFACE AIR
Detonation cell widths in hydrogen-air-diluent mixtures, 15:50890 (R;US)
Experiments in turbulent mixing, 15:51414 (RA;US)

AIR FILTERS
Investigation of fission product retention by the HTR reactor containment building according to the vented confinement concept. Technical report 2.6. Study into the filterability of an accidental atmosphere in the modular HTR, 15:50873 (R;DE;In German)

AIR POLLUTION
A survey to document the decline status of the sugar maple forest of Ontario, 1986, 15:51865 (R;CA)
Analysis of health impact inputs to the US Department of Energy's risk information system, 15:51870 (R;US)
Development of a state-of-the-art acid-deposition model for the South Coast Air Basin of California. Final report, 15:51673 (R;US)
Estimation of seasonal and annual acidic deposition through aggregation of three-day episodic periods. Report for February 1989-1991, 15:51661 (R;US)
Lichens as air pollution biomonitors in a semiarid environment in Idaho, 15:51872 (J;US)
PC-based system for generating EKMA input files. Final report, 15:51664 (R;US)
User's manual for OZIPM-4. Volume 2. Computer code. Final report, 15:51663 (R;US)

AIR POLLUTION ABATEMENT
Reducing emissions through energy efficiency: Options for EPA action. Master's thesis, 15:51670 (R;US)

AIR POLLUTION CONTROL
Influence of the Toxics Release Inventory on State air toxics control programs. Technical report, 15:51669 (R;US)
Microwave induced catalytic destruction of some gaseous air pollutants, 15:51656 (RA;CA)
Procedures for applying city-specific EKMA. Final report, 15:51671 (R;US)
Proceedings: 1990 SO_2 control symposium: Volume 1: Sessions 1, 2, 3A, 3B, and 4A, 15:50768 (R;US)

Double excitation of He by fast ions, 15:51992 (J;US)
Electron emission from collective excitation of solids by heavy ion impact, 15:52250 (RA;US)

CARBON MONOXIDE
Advanced studies of biological indirect liquefaction of coal: Final report, 15:50264 (R;US)
Analysis of CO hydrogenation pathways using the bond-order-conservation method, 15:50301 (J;US)
Coupled catalytic oscillators: CO oxidation over polycrystalline Pt, 15:51330 (J;US)
In situ chemical trapping of CO/H_2 surface species, 15:50296 (J;US)
The origin of the support effect in MgO-supported catalysts, 15:50303 (J;US)

CARBONATES
See also LEAD CARBONATES
A feasibility study of modeling pedogenic carbonates in soils and sediments at the US Department of Energy's Hanford Site, 15:50603 (R;US)

CARBOXYLIC ACIDS
X-ray studies of the liquid/vapor interface: Water and polymer and fatty acid monolayers on water, 15:51300 (BA;US)

CARCINOGENESIS
A possible role of retrotransposons in carcinogenesis, 15:51787 (BA;US)
ras Oncogene proteins: Three-dimensional structures, functional implications, and a model for signal transducer, 15:51779 (BA;US)

CARCINOGENS
Fluorescence line-narrowing spectral analysis of in vivo human hemoglobin-benzo[a]pyrene adducts: Comparison to synthetic analogues, 15:51781 (J;US)

CARCINOMAS
Long-term study on the radiotherapy of squamous cell carcinomas confined to the vocal cord, 15:51798 (R;DE;In German)

CARIBBEAN SEA
Report on land-based sources of marine pollution in the Caribbean. Technical report, 15:51752 (R;US)

CARIBOU
See DEER

CAROLINA POWER LIGHT ROBINSON-2 REACTOR
See ROBINSON-2 REACTOR

CARPOOLING
Implementation of a mezzo-level HOV carpool model for Texas. Final report, September 1986-April 1990, 15:51085 (R;US)

CASCADE MOUNTAINS
Cascade geothermal drilling/corehole N-3: Final report, 15:50748 (R;US)

CASCADE REACTORS
The cascade ICF reactor with an x-ray and debris shield and a heavy-ion driver, 15:52541 (R;US)

CASEIN
Casein gene expression in mouse mammary epithelial cell lines: Dependence upon extracellular matrix and cell type, 15:51784 (J;US)

CASIMIR EFFECT
An accelerating reference frame for electromagnetic waves in a rapidly growing plasma: Unruh radiation and the dynamic Casimir effect, 15:52452 (BA;US)

CATALYST SUPPORTS
EPR characterization of Ti^{3+} ions at the metal-support interface in Pt/TiO_2 catalysts, 15:51329 (J;US)
Novel supports for coal liquefaction catalysts: Quarterly report No. 7, March 1, 1990–May 31, 1990, 15:50273 (R;US)

The origin of the support effect in MgO-supported catalysts, 15:50303 (J;US)

CATALYSTS
Catalytic properties of mineral ion-exchangers previously used in uranium ore wastes treatment. I. Ammoniac octylation in gaseous phase using Y-type faujasite catalysts containing mainly uranium, 15:51308 (R;DZ;In French)
Improved anode catalysts for coal gas-fueled phosphoric acid fuel cells: Final report, 15:51033 (R;US)
In situ chemical trapping of CO/H_2 surface species, 15:50296 (J;US)
Investigations of the activity reduction of DENOX-catalysts, 15:50771 (R;DE;In German)
Novel supports for coal liquefaction catalysts: Quarterly report No. 7, March 1, 1990–May 31, 1990, 15:50273 (R;US)

CATALYTIC CONVERTERS
Microwave induced catalytic destruction of some gaseous air pollutants, 15:51656 (RA;CA)

CATALYTIC EFFECTS
Investigations of the activity reduction of DENOX-catalysts, 15:50771 (R;DE;In German)

CATHODES
See also PHOTOCATHODES
High-current-density thermionic cathodes and the generation of high-voltage electron beams. Final technical report, 1 September 1982-30 April 1989, 15:51947 (R;US)

CATION EXCHANGE CAPACITY
See CATIONS

CATIONS
See also HYDROGEN IONS 1 PLUS
Electron spin resonance spectroscopic studies of radical cation reactions, 15:51307 (R;US)

CAULIFLOWER
See BRASSICA

CAUSTIC FLOODING
New scaling criteria for chemical flooding experiments, 15:50445 (RA;CA)

CAVITY RESONATORS
See also SUPERCONDUCTING CAVITY RESONATORS
Application of linear magnetic loss model of ferrite to induction cavity simulation, 15:51525 (R;US)
Computer determinations of the properties of waveguide loaded cavities, 15:51554 (R;US)
Development of an RFQ linac for unstable nuclei, 15:51536 (R;JP)
Measurement of RF surface efficiency at cryogenic temperatures using a resonant cavity, 15:51548 (R;US)
The design of the RF cavity for the heavy ion storage ring for atomic physics, 15:51569 (R;US)
Theoretical/numerical investigation of induction cavity impedances for moderate to large gap widths, 15:51524 (R;US)

CDF
CDF's prospect for top search and other heavy flavor physics, 15:52048 (BA;US)
Dijet angular distribution and multijet topology at square root of s = 1.8 TeV, 15:52140 (BA;US)
Hadron and electron response of uranium/liquid argon calorimeter modules for the D0 detector, 15:51597 (BA;US)
Inclusive central jets at the Tevatron $\bar{p}p$ collider, 15:52038 (BA;US)
Jet fragmentation properties at CDF, 15:52039 (BA;US)
Minimum bias physics at square root s 1.8 TeV, 15:52032 (BA;US)
The CDF direct photon analysis, 15:52144 (BA;US)
The CDF silicon microstrip vertex detector, 15:51596 (BA;US)
Theoretical implications of the W-Z mass difference and the capabilities of the D0 detector in measuring it, 15:52029 (BA;US)
W boson production in $\bar{p}p$ collisions at square root of s = 1.8 TeV, 15:52030 (BA;US)

CEBAF ACCELERATOR
Beam position measurement in the CEBAF recirculating linacs by use of pseudorandom pulse sequences, 15:51503 (R;US)
Operation of the rf controls in the CEBAF injector, 15:51531 (R;US)
Physics program in Hall A at CEBAF, 15:52156 (R;US)

CEDARS
Sigma Mesa: Background elemental concentrations in soil and vegetation, 1979, 15:51703 (R;US)

CENTRIFUGE ENRICHMENT PLANTS
Report of foreign travel: Training course on enrichment plant safeguards, Luxembourg, June 18–22, 1990, 15:50546 (R;US)

CEPHEIDS
Nonlinear pulsation masses, 15:51917 (R;US)

CERAMIC MELTERS
Chemical aerosol measurement and analysis in the PAMELA plant in Mol/Belgium. Final report, 15:50605 (R;DE;In German)

CERAMICS
High temperature ultrasonic testing of materials for internal flaws, 15:51168 (P;US)
High-performance brittle matrices and brittle-matrix composites. Book 1. Final report, 15 March 1986-30 September 1989, 15:51117 (R;US)
Low heat rejection diesel ceramic coupon tests, 15:51104 (R;US)
Numerical model of bond strength measurements, 15:51155 (BA;US)
Oxygen permeability of selected refractory ceramic oxides in the range 1200-1700°C, 15:51211 (BA;US)
Reinforced ceramics employing discontinuous phases, 15:51175 (R;US)
The effect of temperature on the chemistry and morphology of the interphase in an SCS6/Ti-6Al-4V metal matrix composite, 15:51276 (J;US)
The new superconductors: Prospects for applications, 15:51220 (J;US)
Theoretical studies on the electronic structure and properties of complex ceramic crystals and glasses: Annual progress report, July 1, 1989–June 30, 1990, 15:51182 (R;US)

CEREBRUM
Radiohalogenated thienylethylamine derivatives for evaluating local cerebral blood flow, 15:51832 (P;US)

CERIUM 144
Three-dimensional plume dynamics in the vadose zone: Porflo-3 modeling of a defense waste leak at Hanford, 15:50640 (BA;US)

CERIUM FLUORIDES
Prospects for new inorganic scintillators, 15:51600 (J;US)

CERIUM OXIDES
X-ray absorption studies of $YBa_2Cu_3O_{6+x}$, $La_{2-x}Sr_xCuO_4$, and $Nd_{2-x}Ce_xCuO_4$, 15:51217 (J;US)

CESIUM
Effects of mineralogy on the sorption of strontium and cesium onto Calico Hills tuff, 15:50563 (R;US)
Investigation of the sorption of cesium by graphitic reactor materials, 15:51241 (R;DE;In German)

CESIUM 137
Three-dimensional plume dynamics in the vadose zone: Porflo-3 modeling of a defense waste leak at Hanford, 15:50640 (BA;US)

CESIUM 141
Quasiparticle-core coupling calculations for odd N=83 nuclei, 15:52215 (RA;PL)

CESIUM COMPOUNDS
Methanol and C_2 oxygenate synthesis over cesium doped Cu/ZnO and $Cu/ZnO/Al_2O_3$ catalysts: A study of selectivity and ^{13}C incorporation patterns, 15:50302 (J;US)
CHALKS
See LIMESTONE
CHARGE-EXCHANGE REACTIONS
Delta excitation in charge exchange reactions with heavy ions, 15:52165 (RA;PL)
CHARGED PARTICLES

Bench-scale co-processing: Quarterly report No. 8, January 1, 1990–March 31, 1990, 15:50267 (R;US)
Development of analytical procedures for coprocessing: Quarterly technical progress report, January 1–March 31, 1990, 15:50270 (R;US)

Cost
U.S. and the Pacific Rim: Fueling tomorrow's progress, 15:50369 (RA;US)

Decomposition
Metal arene complexes in coal structure determination: Final report, 15:50312 (R;US)

Desulfurization
Enzymatic desulfurization reactions in hydrated organic media, 15:50282 (RA;US)
Dissolution
Biosolubilization of coal: Process, product, and applications, 15:50283 (RA;US)
The influence of microbial metabolites on low-rank coals solubility in alkaline solutions, 15:50284 (RA;US)
Energy Demand
Senator Mitch McConnell remarks before the Asia-Pacific Coal Technology Conference, 15:50373 (RA;US)
Energy Source Development
Script of presentation by Senator Frank Murkowski on Alaska's coal potential, 15:50338 (RA;US)
Senator Mitch McConnell remarks before the Asia-Pacific Coal Technology Conference, 15:50373 (RA;US)
Enzymatic Hydrolysis
Enzymatic desulfurization reactions in hydrated organic media, 15:50282 (RA;US)
Exports
U.S. coal production and export, 15:50377 (RA;US)
Flotation
Coal surface control for advanced fine coal flotation: Annual report, October 1, 1988–December 31, 1989, 15:50259 (R;US)
In-plant testing of microbubble column flotation: First quarter technical progress report, September 26, 1989–December 31, 1989, 15:50261 (R;US)
Fluidized-Bed Combustion
An investigation of the mechanisms of calcination and sulfation in coal-water mixtures, 15:50367 (R;US)
Field study of disposed solid wastes from advanced coal processes: Annual technical progress report, May 1989–May 1990, 15:50334 (R;US)
Fuel Supplies
Coal supply prospects in the Asia/Pacific region, 15:50380 (R;GB)
Ignition
Experimental studies on group ignition of a cloud of coal particles: Quarterly progress report No. 5, August 16, 1989–November 15, 1989, 15:50365 (R;US)
Infrared Spectra
Spectroscopic study of coal structure and reactivity: Quarterly report, September 15, 1989–December 14, 1989, 15:50307 (R;US)
Maritime Transport
Innovative/alternative ocean transport modes for movement of U.S. coal exports to the Asian Pacific basin, 15:50356 (RA;US)
Marketing
U.S. coal production and export, 15:50377 (RA;US)
Workshop on Asia-Pacific coal technology trade issues, November 16, 1989, 15:50379 (RA;US)
Microstructure
Macromolecular structure of coal, 15:50320 (RA;US)
Molecular Structure
Macromolecular structure of coal, 15:50320 (RA;US)
Spectroscopic study of coal structure and reactivity: Quarterly report, December 15, 1989–March 14, 1990, 15:50308 (R;US)
Studies of coal structure using carbene chemistry: Final report, September 15, 1986–June 14, 1990, 15:50318 (R;US)
Oxidation
Low-temperature (75 to 400°C) oxidation study of coal by diffuse reflectance infrared Fourier transform (DRIFT) spectroscopy, 15:50328 (BA;US)
Natural oxidation of coal, 15:50325 (R;GB)
Pneumatic Transport
Development and utilization of new diagnostics for dense-phase pneumatic transport: Quarterly technical progress report, April 1, 1990–June 30, 1990, 15:50358 (R;US)
Pyrolysis
Hydropyrolysis of coals under pressure: influence of coal pretreatment on the hydropyrolysis yields and mechanisms, 15:50290 (R;XE)
Use of metal hydrous titanium oxide catalysts to enhance coal tar yield via hydropyrolysis, 15:50294 (R;US)
Solubility
Phase behavior of coal fluids: Data for correlation development: [Quarterly progress report], April 15–July 15, 1990, 15:50276 (R;US)
Spontaneous Combustion
Suppression methods for deep-seated coal fires. Final report, 15:50354 (R;US)
Sulfur Content
Script of presentation by Senator Frank Murkowski on Alaska's coal potential, 15:50338 (RA;US)
Surface Properties
Chemical characterization of the surface sites of coal: Technical progress report, July–September 1989, 15:50310 (R;US)
Chemical characterization of the surface sites of coal: Technical progress report, October–December 1989, 15:50311 (R;US)
Coal surface control for advanced fine coal flotation: Quarterly report No. 7, April 1, 1990–June 30, 1990, 15:50260 (R;US)
Coal surface control for advanced physical fine coal cleaning technologies: Annual report, September 19, 1988–December 31, 1989, 15:50258 (R;US)
Swelling
Influence of weathering and low-temperature oxidation on the thermoplastic properties of coal, 15:50327 (BA;US)
Thermodynamics of the solvent swelling of coal: Technical progress report No. 7, March 1, 1990–May 31, 1990, 15:50315 (R;US)
Thermodynamics of the solvent swelling of coal: Technical progress report No. 8, June 1, 1990–August 31, 1990, 15:50316 (R;US)
Transport
Innovative/alternative transport modes for movement of U.S. coal exports to the Asian Pacific basin, 15:50357 (RA;US)
Pacific rim coal trade issues innovative transport modes, 15:50355 (RA;US)
U.S. and the Pacific Rim: Fueling tomorrow's progress, 15:50369 (RA;US)
Velocity
Theoretical and numerical studies of constitutive relations for frictional granular flow: Annual report, January–December 1989, 15:50363 (R;US)

COAL EXTRACTS
Characterization and subsequent utilization of microbially solubilized coal: Preliminary studies, 15:50324 (RA;US)
Spectroscopic study of coal structure and reactivity: Quarterly report, September 15, 1989–December 14, 1989, 15:50307 (R;US)

COAL GASIFICATION
Clean coal technology program/solid waste management, 15:50333 (R;US)
Studies of the processes of coal utilisation and conversion, 15:50291 (R;XE;In French)

COAL GASIFICATION PLANTS
Environmental monitoring plan for the Dow Syngas Project. Annual report, January 1-December 31, 1989, 15:50337 (R;US)
The ENCOAL Mild Gasification Demonstration Project, 15:50263 (R;US)

COAL INDUSTRY
Representative Ralph Regula, 15:50336 (RA;US)
The United States and Asia: Pacific partners in coal and coal technology, 15:50376 (RA;US)
U.S. coal production and export, 15:50377 (RA;US)
Workshop on Asia-Pacific coal technology trade issues, November 16, 1989, 15:50379 (RA;US)

COAL LIQUEFACTION
Biosolubilization of coal: Process, product, and applications, 15:50283 (RA;US)

COAL LIQUIDS
Biosolubilization of coal: Process, product, and applications, 15:50283 (RA;US)
Effectiveness factors for hydroprocessing of coal and coal liquids: Progress report No. 11, March 16, 1990–June 15, 1990, 15:50269 (R;US)

COAL MINES
Advances in electrical network technology II, 15:50345 (R;XE;In German)
Computer-assisted district control centres, 15:50347 (R;XE;In German)
Development of underground switchgear, 15:50348 (R;XE)
Feasibility of controlled ventilation, 15:50342 (R;XE)
New drilling techniques, 15:50346 (R;XE;In French)
Proceedings, 1989 multinational conference on mine planning and design, 15:50352 (R;US)
Underground data communications, 15:50349 (R;XE)

COAL PREPARATION
Coal surface control for advanced physical fine coal cleaning technologies: Annual report, September 19, 1988–December 31, 1989, 15:50258 (R;US)

COAL RANK
Effects of coal structure on pulverized coal conversion processes: Final report, October 1, 1985–August 31, 1989, 15:50313 (R;US)

COAL SEAMS
Cross-borehole observation of mode conversion from borehole Stoneley waves to channel waves at a coal layer, 15:50353 (J;US)
Development of a method of mine gas control, 15:50341 (R;XE;In German)

COAL TAR
Use of metal hydrous titanium oxide catalysts to enhance coal tar yield via hydropyrolysis, 15:50294 (R;US)

COAL-DERIVED LIQUIDS
See COAL LIQUIDS

COAL-OIL MIXTURES
See COAL
FUEL SLURRIES

COATED FUEL PARTICLES
DELIGHT-7: one dimensional fuel cell burnup analysis code for High Temperature Gas-cooled Reactors (HTGR), 15:50788 (R;JP;In Japanese)

COATINGS
See also ANTIREFLECTION COATINGS
ENERGY BEAM DEPOSITION FILMS
PAINTS
PROTECTIVE COATINGS
An in situ grazing-incidence x-ray diffraction study of the initial stages of electrochemical growth of lead on silver(111), 15:51134 (RA;US)
Location of defects on rotating cylinder electrodes, 15:51149 (BA;US)

COBALT
Catalytic functionalities of supported sulfides V. C-N bond hydrogenolysis selectivity as a function of promoter type, 15:50454 (J;US)
Novel supports for coal liquefaction catalysts: Quarterly report No. 7, March 1, 1990–May 31, 1990, 15:50273 (R;US)
Secondary reactions on metal-zeolite catalysts used in synthesis gas conversion, 15:50299 (J;US)

COBALT ALLOYS
See also COBALT BASE ALLOYS
Combined neutron and x-ray powder diffraction study of $Fe_{0.50}Co_{0.48}V_{0.02}$, 15:51166 (J;US)
The measurement of single particle temperature in plasma sprays, 15:51177 (RA;US)

COBALT BASE ALLOYS
See also HAYNES ALLOYS
Effect of internal oxidation pretreatments and Si contamination on oxide-scale growth and spalling, 15:51162 (J;US)

COBALT BORIDES
Theoretical studies on the electronic structure and properties of complex ceramic crystals and glasses: Annual progress report, July 1, 1989–June 30, 1990, 15:51182 (R;US)

COBALT OXIDES
Anodically-coloring electrochromic $LiCoO_2$ thin films, 15:51214 (BA;US)

COCAINE
Graphical analysis of reversible radioligand binding from time-activity measurements applied to [N-^{11}C-methyl]-(-)-cocaine PET studies in human subjects, 15:51829 (J;US)

CODING CIRCUITS
See DIGITAL CIRCUITS

COILS (MAGNETIC)
See MAGNET COILS

COKE
Development of an alkali-resistant coke, 15:50304 (R;XE)

COKE OVENS
Influence of charge density on coking in a wide chamber oven, 15:50288 (R;XE;In Italian)
Study of the transitory stages of the coking process, 15:50287 (R;XE;In French)

COKING
Influence of charge density on coking in a wide chamber oven, 15:50288 (R;XE;In Italian)

COKING PLANTS
Final environmental information volume for the coke oven gas cleaning project at the Bethlehem Steel Corporation Sparrows Point Plant, 15:50274 (R;US)
Study of the transitory stages of the coking process, 15:50287 (R;XE;In French)

COLD LAKE DEPOSIT
A study of fines migration related permeability damage in extracted Cold Lake heavy oil cores, 15:50537 (RA;CA)

COLLECTIVE ACCELERATORS
Collective ion acceleration in anode plasma diode, 15:51541 (R;UA;In Russian)

COLLECTIVE MODEL
Quantum chaoticity and fractional parentage plot based on the microscopic theory of nuclear collective dynamics: Violation of separability condition to specify optimum collective subspace, 15:52218 (R;JP)

COLLECTOR PROPERTIES
See PERMEABILITY

COLLECTOR PROPERTIES (ROCKS)
See PERMEABILITY

COLLIDER DETECTOR AT FERMILAB
See CDF

COLLIDING BEAMS
A preliminary design of the PS-Collider: Design report 1, 15:51539 (R;JP;In Japanese)
On asymmetric collisions with large disruption parameters, 15:51504 (R;US)

COLLIERIES
See COAL MINES

COLLIMATORS
Simple models of pinhole closure in high-energy-density experiments, 15:52400 (BA;US)

COLLISIONAL PLASMA
IRAS observations of collisionally heated dust in Large Magellanic Cloud supernova remnants, 15:51932 (BA;US)
On the use of atmospheric pressure plasmas as electromagnetic reflectors and absorbers, 15:52559 (J;US)
Spectral shifting of intense femtosecond pulses during strong field ionization and plasma recombination, 15:51979 (BA;US)

COLLISIONLESS PLASMA
Dynamic trapping of electrons in space plasmas, 15:51941 (R;SE)
Halo feedback control of trapped particle instabilities, 15:52494 (J;US)
Particle distributions in collisionless magnetic reconnection: An implicit Particle-In-Cell (PIC) description, 15:52543 (R;US)

COLLOID COAGULATION

Synthesis and property evaluation of $YBa_2Cu_3O_{6+x}$ superconductors. Interim report, October 1988-September 1989, 15:51169 (R;US)
Thermal Conductivity
Photothermal measurements of high-T_c superconductors, 15:51179 (RA;US)
Transition Temperature
X-ray-absorption fine-structure studies of superconducting $Tl_2CaBa_2Cu_2O_x$ thin films, 15:51224 (J;US)
X-Ray Spectra
X-ray-absorption fine-structure studies of superconducting $Tl_2CaBa_2Cu_2O_x$ thin films, 15:51224 (J;US)

COPPER SELENIDE SOLAR CELLS
Novel thin-film $CuInSe_2$ fabrication: Final subcontract report, 15:50720 (R;US)

COPPER VAPOR LASERS
See GAS LASERS

COPROCESSING
Development of analytical procedures for coprocessing: Quarterly technical progress report, January 1–March 31, 1990, 15:50270 (R;US)

CORES (REACTOR)
See REACTOR CORES

CORONA (SOLAR)
See SOLAR CORONA

CORONARIES
Pediatric cardiovascular nuclear medicine, 15:51828 (BA;US)

COSMIC DUST
Infrared spectroscopy and mapping of IC443, 15:51931 (BA;US)

COSMIC GAMMA BURSTS
A new phase of QED and narrow peaks in heavy-ion collisions, 15:52133 (BA;US)

COSMIC GASES
The plasma universe, 15:51942 (R;SE)

COSMIC MUONS
Feasibility of cosmic-ray-muon intensity measurements for tunnel detection. Final report, February 1989-February 1990, 15:51896 (R;US)

COSMIC NEUTRINOS
Study of electron-positron interactions: Progress report, 15:52014 (R;US)

COSMOLOGICAL MODELS
Is the propagation of electromagnetic radiation in cosmological backgrounds in agreement with the standard model?, 15:52338 (R;XA)
Quantum theory of gauge fields in Robertson-Walker spacetime, 15:52349 (RA;DD)
Two cosmological aspects of interacting quantum field theory: Particle production and CPT non-invariance, 15:52347 (RA;DD)

COSMOS
See UNIVERSE

COUNTERS (RADIATION)
See RADIATION DETECTORS

COUNTING TECHNIQUES
A new approach for precise measurements of keV neutron capture cross sections: The examples of ^{93}Nb, ^{103}Rh, and ^{181}Ta, 15:51585 (R;DE)

COUNTY BUILDINGS
See PUBLIC BUILDINGS

COURT BUILDINGS
See PUBLIC BUILDINGS

CP INVARIANCE
CP asymmetries in B^0 decays beyond the Standard Model, 15:52071 (R;US)
Future prospects for CP violation, 15:52098 (BA;US)
Indirect searches for very heavy quarks, 15:52128 (BA;US)
Status of CP violation experiments at Fermilab, 15:52094 (BA;US)

CRACKS
Effects of distributed microcracking on effective wave speed and attenuation of ultrasound, 15:51420 (RA;US)

CREEKS
See STREAMS

CREEP
Practical testing of capacitive strain gages for measuring of creep at 530 to 600deg C, 15:51611 (R;DE;In German)

CRITICAL CURRENT
NDE of critical currents in high T_c superconductors, 15:51178 (RA;US)

CROPS
Improving rapeseed production practices in the southeastern United States: Final project report, 15:51841 (R;US)

CROSSED BEAMS
See COLLIDING BEAMS

CRUDE OIL
See PETROLEUM

CRYOSTATS
Self-compression of the multilayer insulation around the horizontal cylindrical shield, 15:51468 (BA;US)

CRYSTAL MODELS
See also HEISENBERG MODEL
ISING MODEL
Modeling electron-electron interactions in reduced-dimensional materials: Bond-charge Coulomb repulsion and dimerization in Peierls-Hubbard models, 15:52302 (J;US)

CRYSTALLOGRAPHY
Time-resolved macromolecular crystallography, 15:51812 (RA;US)

CULTURE MEDIA
Modification of MCDB 110 medium to support prolonged growth and consistent high cloning efficiency of diploid human fibroblasts, 15:51785 (J;US)

CULTURES (TISSUE)
See TISSUE CULTURES

CUMULATIVE EFFECT
See PARTICLE PRODUCTION

CURIUM
Fabrication of neptunium, plutonium, americium and curium metals for fuel research: Review report, 15:51371 (R;JP;In Japanese)
New strategy for minor actinides partitioning preliminary results on the electrovolatilization of ruthenium and on the stabilization of Am(IV) in nitric acid with phosphotunsgstate ligand, 15:50550 (R;FR)

CURRENT (DIRECT)
See DIRECT CURRENT

CURRENT (LEAKAGE)

Far-infared laser spectroscopy of two dimensional holes in strained-layer heterostructure and superlattices, 15:52298 (R;US)
Flat response detectors from UV and x-ray region, 15:52433 (BA;US)
Photoabsorption modulation in GaAs: $Ga_{1-x}In_x$ as strained-layer superlattices, 15:52290 (R;US)
GAMMA RADIATION
Protection by WR-2721 and WR-151327 against late effects of gamma rays and neutrons, 15:51843 (R;US)
GAMMA REACTIONS
See PHOTONUCLEAR REACTIONS
GAMMA SPECTRA
Multiple Group Analysis (MGA): A gamma-ray spectrum analysis code for determining plutonium isotopic abundances: Volume 2, A guide to using MGA, 15:51373 (R;US)
GAMMA SPECTROSCOPY
Prospects of CsJ(Tl)-photodiode detectors for low level spectroscopy, 15:51588 (R;DE)
GAS APPLIANCES
Effect of rangetop burner design on NO_2 emissions. Final report, February 1986-March 1987, 15:50519 (R;US)
GAS BURSTS
See ROCK BURSTS
GAS CONDENSATE WELLS
Transient and steady-state aspects of gas condensate well performance, 15:50509 (RA;CA)
GAS COOLANTS
See GASES
GAS CYLINDERS
Research of acoustic emissions in natual gas vehicle storage cylinders, 15:50521 (R;CA)
GAS FIELDS
See NATURAL GAS FIELDS
GAS GENERATORS
Costs for advanced coal-combustion technologies. Final report, 15:50368 (R;US)
GAS INJECTION
Foam forming surfactants in Pembina/Ostracod G Pool, 15:50417 (RA;CA)
GAS LASERS
See also EXCIMER LASERS
METAL VAPOR LASERS
Microwave excitation of copper vapor plasmas: Final report, 15:50648 (R;US)
GAS LIFTS
Economical distribution of gas in a continuous gas-lift system subject to variable cost and system constraint, 15:50409 (RA;CA)
GAS METAL-ARC WELDING
Process controllability in gas metal arc-welding: Micro and macroscopic problems, 15:51123 (RA;US)
GAS SATURATION
A dual-gas tracer technique for determining trapped gas saturation during steady foam flow in porous media, 15:50450 (R;US)
GAS TURBINES
Electrostatic fuel atomization and spray-dispersal demonstration. Final report, September 1989-January 1990, 15:51102 (R;US)
Evaluation of water-injection impacts for gas-turbine NOx control at compressor stations. Topical report, June-September 1989, 15:50518 (R;US)
GAS WELLS
See NATURAL GAS WELLS
GAS-INSULATED CABLES
Development of 230-kV high-pressure, gas-filled, pipe-type cable system: Model test program phase, 15:50906 (R;US)
GASEOUS DIFFUSION PLANTS
See also ORGDP
PADUCAH PLANT
Report of foreign travel: Training course on enrichment plant safeguards, Luxembourg, June 18–22, 1990, 15:50546 (R;US)
GASEOUS EFFLUENTS
See GASEOUS WASTES
GASEOUS WASTES
See also EXHAUST GASES
FLUE GAS
Combined separation and retainment of particles and gases with cleanable filters, 15:51649 (R;DE;In German)
GASES
See also AIR
COSMIC GASES
ELECTRON GAS
EXHAUST GASES
SYNTHESIS GAS
Direct conversion of light hydrocarbon gases to liquid fuel: Quarterly technical status report No. 8 for second quarter FY 1990, 15:50677 (R;US)
Effects of two-phase flow in a model for nitramine deflagration, 15:51382 (J;US)
Radiation interactions in high-pressure gases, 15:51952 (R;US)
Simulations of intense laser beams interacting with gases and solids, 15:51977 (BA;US)
Transport of long-pulse, high-current electron beams in preformed monatomic plasma channels in the ions focus regime, 15:52495 (J;US)
GASKETS
Argon gas analysis to predict water leakage into the W88, 15:51630 (R;US)
GASOLINE
Secondary reactions on metal-zeolite catalysts used in synthesis gas conversion, 15:50299 (J;US)
GAUGE INVARIANCE
A dynamical model of pion photoproduction on nucleon in Δ-region, 15:52074 (BA;US)
A physical interpretation of the 3rd cocycle in the group cohomology of nonAbelian gauge theories, 15:52137 (BA;US)
Anomalies, cocycles and Schwinger terms, 15:52097 (BA;US)
Classical geometrical interpretation of ghost fields and anomalies in Yang-Mills theory and quantum gravity, 15:52141 (BA;US)
Effective actions, decoupling and anomalies in chiral gauge theories, 15:52149 (BA;US)
Electroweak interactions at the SSC, 15:52096 (BA;US)
Overview of the Standard Model, 15:52093 (BA;US)
Problems of describing spin −3/2 baryon resonances in the effective lagrangian theory, 15:52139 (BA;US)
GAUGE TRANSFORMATIONS
See GAUGE INVARIANCE

GAUSS DISTRIBUTION
See GAUSS FUNCTION
GAUSS FUNCTION
The Gaussian effective potential, 15:52122 (RA;DD)
GEESTHACHT-1 RESEARCH REACTOR
See FRG-1 REACTOR
GEESTHACHT-2 RESEARCH REACTOR
See FRG-2 REACTOR
GELS
A comparison of mechanical properties and scaling law relationships for silica aerogels and their organic counterparts, 15:51259 (R;US)
In-situ pore structure analysis during aging and drying of gels, 15:51193 (R;US)
Synthetic control of molecular structure in organic aerogels, 15:51327 (BA;US)
GENE LOCI
See GENES
GENE MUTATIONS
An improved method for detecting genetic variation in DNA using denaturing gradient gel electrophoresis, 15:51842 (R;JP)
GENERATORS (PULSE)
See PULSE GENERATORS
GENERATORS (STEAM)
See STEAM GENERATORS
GENES
See also ONCOGENES
Identification of the gene coding for the precursor of adenovirus core protein X, 15:51835 (J;US)
Nucleotide sequence of the triosephosphate isomerase gene from Macaca mulatta, 15:51783 (J;GB)
Sequence of the Erysiphe graminis f. sp. hordei gene encoding β-tubulin, 15:51780 (J;GB)
GENETIC ENGINEERING
Survey of selected topics relevant to bioprocess engineering. Technical note (Final), 15:50716 (R;US)
GENETIC MAPPING
Genes and gene expression: Localization, damage and control: A multilevel and inter-disciplinary study: Progress report, February 1, 1990–January 31, 1991, 15:51786 (R;US)
GENITALS (MALE)
See MALE GENITALS
GEOLOGIC DEPOSITS
See also NATURAL GAS DEPOSITS
OIL SAND DEPOSITS
PETROLEUM DEPOSITS
SALT DEPOSITS
Radiocarbon dates from the western basin of the Champlain Sea. Paper No. 89-22, 15:51887 (R;CA)
GEOLOGIC FRACTURES
A stratified percolation model for saturated and unsaturated flow through natural fractures, 15:50630 (BA;US)
Modelling of flow and contaminant migration in single rock fractures, 15:50612 (R;SE)
Permeability and dispersivity of variable-aperture fracture systems, 15:50631 (BA;US)
Study of fractal aperture distribution and flow in fractures, 15:50629 (BA;US)
GEOLOGY
See also PETROLEUM GEOLOGY
Iowa State Mining and Mineral Resources Research Institute: Final report, July 1, 1989–June 30, 1990, 15:51884 (R;US)
GEOMAGNETIC FIELD
Solar-Geophysical Data Number 549, May 1990. Part 1 (Prompt Reports). Data for April, March 1990, and late data, 15:51919 (R;US)
GEOMAGNETIC STORMS
See MAGNETIC STORMS
GEOMETRY
See also DIFFERENTIAL GEOMETRY
Metric equations in geometry and their applications, 15:52318 (R;XA)
GEOPHYSICAL SURVEYS
Feasibility of cosmic-ray-muon intensity measurements for tunnel detection. Final report, February 1989-February 1990, 15:51896 (R;US)
GEOPRESSURED SYSTEMS
Environmental monitoring at designed geopressured-geothermal well sites, Louisiana and Texas: Quarterly status report, July, August, September 1990, 15:50749 (R;US)
GEORGIA
Georgia/Alabama regional seismographic network: Volume 3, Annual report, July 1987–June 1988, 15:51888 (R;US)
Radionuclide concentrations from waters of selected aquifers in Georgia. Technical report, 15:51749 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Georgia, 15:50963 (R;US)
GEOTHERMAL ENERGY
Geothermal development opportunities in developing countries: Seminar proceedings, 15:50745 (R;US)
GEOTHERMAL POWER PLANTS
Modular wellhead binary power system: Preliminary design results: Final report, 15:50750 (R;US)
GEOTHERMAL RESOURCES
Southern New Mexico low temperature geothermal resource economic analysis: Final technical report, 15:50746 (R;US)
GEOTHERMAL SYSTEMS
Environmental monitoring at designed geopressured-geothermal well sites, Louisiana and Texas: Quarterly status report, July, August, September 1990, 15:50749 (R;US)
GEOTHERMAL WELLS
Cascade geothermal drilling/corehole N-3: Final report, 15:50748 (R;US)
GERMAN FEDERAL REPUBLIC
See FEDERAL REPUBLIC OF GERMANY
GERMANIUM
Multifractal structure of attractors at the quasiperiodic transition to chaos for electron-hole plasma instability in Ge, 15:52294 (RA;US)
GERMANIUM ALLOYS
Thin films, composites, and superconducting junctions. Interim report, 1 October 1984-31 March 1985, 15:51120 (R;US)
GERMANIUM ARSENIDES
Effect of pressure on the DX centers in GaAs and related GaAlAs semiconductor alloys, 15:51245 (RA;US)
Optical characterization of epitaxial GaAs films grown on Si, 15:51244 (RA;US)
Pressure dependence of Schottky barrier at the Pt/GaAs interface, 15:51247 (RA;US)
Reduction of persistent photoconductivity due to DX centers in GaAs by boron, 15:51246 (RA;US)
GERMANIUM COMPOUNDS
See also GERMANIUM ARSENIDES
Bias-induced nonlinearities in neutron-transmutation-doped germanium at ^{4}He temperatures, 15:51577 (RA;US)
GERMANY (FEDERAL REPUBLIC)
See FEDERAL REPUBLIC OF GERMANY
GERMS (MICROORGANISMS)
See MICROORGANISMS
GIANT CELLS
See TUMOR CELLS
GIANT RESONANCE
The giant dipole resonance built on highly excited states, 15:52184 (RA;PL)
GLASS
See also BOROPHOSPHATE GLASS
BOROSILICATE GLASS
PHOSPHATE GLASS
Application of the NNWSI [Nevada Nuclear Waste Storage Investigations] unsaturated test method to actinide doped SRL [Savannah River Laboratory] 165 type glass, 15:50561 (R;US)
Chemical reactions at glass/liquid interfaces, 15:51262 (BA;US)
Consequences of simultaneous exposure of inorganic solids to excimer laser light and an electron beam, 15:51277 (J;US)
Correlation of MITT [Materials Interface Interactions Test] glass and waste glass compositions, 15:50583 (RA;LU)

Development of dual-fiber-reinforced glass-matrix composites for structural space-based applications. Final report, 14 March 1988-14 March 1990, 15:51234 (R;US)
Investigation of laser-surface interactions and optical damage mechanisms using excitation by pairs of picosecond laser pulses, 15:51269 (J;US)
Monitoring of MIIT [Materials Interface Interactions Test] glass solution interactions by brine analysis, 15:50587 (RA;LU)
Process for direct conversion of reactive metals to glass, 15:51281 (P;US)
Repository system simulation test surface analysis of SON 68 glass coupons, 15:50589 (RA;LU)
Summary of WIPP [Waste Isolation Pilot Plant] materials Interface Interactions Test data on metals interactions and leachate brine analyses, 15:50586 (RA;LU)
Surface analysis data from in-situ testing of ferri-silicate TRUW [transuranic waste] glass WG 124 in the WIPP-MIIT [Waste Isolation Pilot Plant-Materials Interface Interaction Test] facility, 15:50584 (RA;LU)
Theoretical studies on the electronic structure and properties of complex ceramic crystals and glasses: Annual progress report, July 1, 1989–June 30, 1990, 15:51182 (R;US)

GLASS MELTERS
See CERAMIC MELTERS

GLAUBER'S SALT
See SODIUM SULFATES

GLIOMAS
Uptake of a certain nidocarboranyl porphyrin by human glioma xenografts in athymic nude mice and by syngeneic ovarian carcinomas in immunocompetent mice, 15:51826 (BA;US)

GLUEBALLS
Production and phenomenology of glueballs, 15:52146 (BA;US)

GLUON MODEL
Production and phenomenology of glueballs, 15:52146 (BA;US)

GLUONIUM
See GLUEBALLS

GLUONS
Approximate four jet cross sections, 15:52075 (BA;US)
Non-abelian gauge theory in a constant homogeneous background, 15:52108 (RA;DD)
The meson spectrum between 1 and 2 GeV: Gluonic states and other exotica, 15:52023 (R;US)

GLYCYLGLYCINE
Calculated yields of ammonia in the radiolysis of deoxygenated solutions of glycylglycine, 15:52267 (RA;US)

GLYOXAL
Laser-induced phosphorescence spectroscopy in supersonic jets: The lowest triplet states of glyoxal, methyglyoxal, and biacetyl, 15:51969 (BA;US)
Rotational analysis of some vibronic bands in the $^3A_u \leftarrow {}^1A_g$ transition of Glyoxal: Spin splittings in the lowest triplet state of the isolated molecule, 15:51968 (BA;US)

GOBAR GAS
See METHANE

GOLD
Adsorption of pyridine on polycrystalline gold electrode studied by radioactive-labeling method, 15:51346 (R;US)
Infrared reflection spectroscopy: Probing structure-reactivity relationships at liquid-solid interfaces, 15:51322 (BA;US)
Measurement of mercury vapor adsorption on gold using a micromirror, optical fiber sensor, 15:51328 (BA;US)
Potential barrier for tunneling electrons in STM [scanning tunneling microscope], 15:52244 (RA;US)
Potential-dependent reconstruction of Au(111) and (100) surfaces in solution, 15:51313 (RA;US)
Radioactive-labeling study of sulfate/bisulfate adsorption on smooth gold electrodes, 15:51345 (R;US)
Work in progress, 15:51314 (RA;US)

GOLD 197 TARGET
New results from AGS [Alternating Gradient Synchrotron] heavy-ion experiments, 15:52155 (R;US)

GOLDSTONE BOSONS
Goldstone-boson equivalence theorem and the Higgs resonance, 15:52083 (J;US)
Neutral technicolor pseudo Goldstone bosons production and QCD [quantum chromodynamics] background at the SSC [Superconducting Super Collider], 15:52060 (R;US)

GOSATOMNADZOR
The USSR State Committee for Supervising Work Safety in the Nuclear Power Industry: information and remarks, 15:50841 (R;GB)

GOVERNMENT POLICIES

HIGH-LEVEL RADIOACTIVE WASTES
Containers
[Nuclear waste containment at Yucca Mountain], 15:50623 (BA;US)
Containment
Use of performance assessment in assessing compliance with the containment requirements in 40 CFR Part 191, 15:50601 (R;US)
Coordinated Research Programs
Correlation of MITT [Materials Interface Interactions Test] glass and waste glass compositions, 15:50583 (RA;LU)
Repository systems simulation test (RRT) salt environment: Preliminary conclusions, 15:50591 (RA;LU)
Repository systems simulation test clay option: Preliminary conclusions, 15:50593 (RA;LU)
Summary of WIPP [Waste Isolation Pilot Plant] materials Interface Interactions Test data on metals interactions and leachate brine analyses, 15:50586 (RA;LU)
The granite option of the repository simulation test: Preliminary conclusions, 15:50592 (RA;LU)
In-Situ Processing
Characterization of BNFL [British Nuclear Fuels Ltd] glasses containing simulated high level waste, 15:50578 (RA;LU)
Elemental profiling by SIMS [secondary ion mass spectrometry] of leached layers in repository tested SRL [Savannah River Laboratory] waste glass, 15:50580 (RA;LU)
Examination of the German borosilicate nuclear waste glass SM513LW11, 15:50577 (RA;LU)
Infrared reflection spectroscopy–part of an integrated approach to MIIT [Materials Interface Interactions Test] sample analysis, 15:50581 (RA;LU)
MIIT [Materials Interface Interactions Tests] study and related activity at WASTEF [Waste Safety Testing Facility], 15:50579 (RA;LU)
Surface analysis data from in-situ testing of ferri-silicate TRUW [transuranic waste] glass WG 124 in the WIPP-MIIT [Waste Isolation Pilot Plant-Materials Interface Interaction Test] facility, 15:50584 (RA;LU)
Technical operations and data collection details of the in situ WIPP [Waste Isolation Pilot Plant] Materials Interface Interactions Test, 15:50575 (RA;LU)
The high-level radioactive waste (HAW) in-situ test at ASSE - its conception and goals, 15:50571 (RA;LU)

The in-situ testing program in the HADES [High Activity Disposal Experimental Site] facility, 15:50572 (RA;LU)
United States in situ test programs: WIPP [Waste Isolation Pilot Plant] studies, 15:50573 (RA;LU)
WIPP/SRL [Waste Isolation Pilot Plant/Savannah River Laboratory] international in situ testing program - MIIT [Materials Interface Interactions Tests], 15:50574 (RA;LU)

Quantitative Chemical Analysis
Elemental profiling by SIMS [secondary ion mass spectrometry] of leached layers in repository tested SRL [Savannah River Laboratory] waste glass, 15:50580 (RA;LU)

Radioactive Waste Disposal
Analysis of leachates and of surface features on glass R7T7 after corrosion in a sodium chloride brine, 15:50588 (RA;LU)
Characterization of BNFL [British Nuclear Fuels Ltd] glasses containing simulated high level waste, 15:50578 (RA;LU)
Correlation of MITT [Materials Interface Interactions Test] glass and waste glass compositions, 15:50583 (RA;LU)
Dissolution behavior of HLW [high-level waste] borosilicate glass, 15:50582 (RA;LU)
Evaluation of the geologic relations and seismotectonic stability of the Yucca Mountain area, Nevada Nuclear Waste Site Investigation (NNWSI): Final report, January 1, 1987–June 30, 1988: Volume 1, 15:50566 (R;US)
Examination of the German borosilicate nuclear waste glass SM513LW11, 15:50577 (RA;LU)
Examination of ultrathin cross sections from R7T7 glass samples after 6 months and 1 year of alteration in the WIPP [Waste Isolation Pilot Plant], 15:50576 (RA;LU)
Infrared reflection spectroscopy–part of an integrated approach to MIIT [Materials Interface Interactions Test] sample analysis, 15:50581 (RA;LU)
MIIT [Materials Interface Interactions Tests] study and related activity at WASTEF [Waste Safety Testing Facility], 15:50579 (RA;LU)
Monitoring of MIIT [Materials Interface Interactions Test] glass solution interactions by brine analysis, 15:50587 (RA;LU)
Observations of surface layers formed on basaltic and borosilicate glass: 6 month and 1 year MIIT [Materials Interface Interaction Test] experiments, 15:50585 (RA;LU)
Repository system simulation test surface analysis of SON 68 glass coupons, 15:50589 (RA;LU)
Repository systems simulation test (RRT) salt environment: Preliminary conclusions, 15:50591 (RA;LU)
Repository systems simulation test clay option: Preliminary conclusions, 15:50593 (RA;LU)
Summary of WIPP [Waste Isolation Pilot Plant] materials Interface Interactions Test data on metals interactions and leachate brine analyses, 15:50586 (RA;LU)
Surface analysis data from in-situ testing of ferri-silicate TRUW [transuranic waste] glass WG 124 in the WIPP-MIIT [Waste Isolation Pilot Plant-Materials Interface Interaction Test] facility, 15:50584 (RA;LU)
Technical operations and data collection details of the in situ WIPP [Waste Isolation Pilot Plant] Materials Interface Interactions Test, 15:50575 (RA;LU)
The granite option of the repository simulation test: Preliminary conclusions, 15:50592 (RA;LU)
The high-level radioactive waste (HAW) in-situ test at ASSE - its conception and goals, 15:50571 (RA;LU)
United States in situ test programs: WIPP [Waste Isolation Pilot Plant] studies, 15:50573 (RA;LU)
WIPP/SRL [Waste Isolation Pilot Plant/Savannah River Laboratory] international in situ testing program - MIIT [Materials Interface Interactions Tests], 15:50574 (RA;LU)

Research Programs
RSST [Repository system simulation tests] in granite: Additional tests at CEN-Valrho, 15:50590 (RA;LU)
Repository system simulation test surface analysis of SON 68 glass coupons, 15:50589 (RA;LU)
The in-situ testing program in the HADES [High Activity Disposal Experimental Site] facility, 15:50572 (RA;LU)

Storage
Corrosion resistant storage container for radioactive material, 15:50559 (P;US)

Underground Disposal
Application of the NNWSI [Nevada Nuclear Waste Storage Investigations] unsaturated test method to actinide doped SRL [Savannah River Laboratory] 165 type glass, 15:50561 (R;US)
COVE 2A benchmarking calculations using LLUVIA, 15:50607 (R;US)
Drill-back studies examine fractured, heated rock, 15:50633 (BA;US)
Fabrication development for high-level nuclear waste containers for the tuff repository: Phase 1 final report, 15:50613 (R;US)
Geochemical modeling: An integrated approach to nuclear waste disposal issues, 15:50625 (BA;US)
Simulation of heat transfer in the unsaturated zone, 15:50632 (BA;US)
Thermal stability of zeolitic tuff from Yucca Mountain, Nevada, 15:50624 (BA;US)
US DOE-AECL cooperative program for development of high-level radioactive waste container fabrication, closure, and inspection techniques, 15:50615 (R;US)

Underground Storage
Tank farm surveillance and waste status summary report for June 1990, 15:50616 (R;US)

Vitrification
Establishing the acceptability of Savannah River site waste glass, 15:50622 (R;US)
The Swedish programme for in-situ testing of high-level waste forms, 15:50570 (RA;LU)

HIGH-TC SUPERCONDUCTORS
Phenomenology of forces acting between magnets and superconductors, 15:51438 (R;US)
Some aspects of the theory of high temperature superconductors, 15:52308 (R;US)

Antiferromagnetism
Dynamic correlations in a classical two-dimensional Heisenberg antiferromagnet, 15:51273 (J;US)

Bromination
Processing parameters and kinetics of bromination and chlorination in the $YBa_2Cu_3O_{6+x}$ system, 15:51196 (R;US)

Chemical Composition
A metallurgical approach to high-T_c microcomposites, 15:51473 (J;US)

Chlorination
Processing parameters and kinetics of bromination and chlorination in the $YBa_2Cu_3O_{6+x}$ system, 15:51196 (R;US)

Cracks
Effects of distributed microcracking on effective wave speed and attenuation of ultrasound, 15:51420 (RA;US)

Critical Current
NDE of critical currents in high T_c superconductors, 15:51178 (RA;US)

Electric Conductivity
Apparatus for measurement of surface resistance versus rf magnetic field of high-T_c superconductors, 15:51483 (J;US)

Electrical Properties
Electrical properties of high-temperature superconductors at microwave frequencies, 15:51174 (R;US)

Electrodynamics
Nonlinear electrodynamics in the granular superconductor $YBa_2Cu_3O_7$: Experiments and interpretation, 15:52314 (RA;US)
Symmetry breaking and nonlinear electrodynamics in the ceramic superconductor $YBa_2Cu_3O_7$, 15:51189 (RA;US)
Work in progress, 15:52315 (RA;US)

Energy Absorption
Work in progress, 15:51188 (RA;US)

Air sinterable $LaCrO_3$ based ceramics, 15:51209 (BA;US)
Characterization of electrically conducting oxides: [Progress report], January 16, 1989–December 31, 1989, 15:51183 (R;US)
Explanation of normal-state properties of high-temperature superconductors, 15:51230 (J;US)
Hall effect and electronic structure of $La_{2-x}Sr_xCuO_4$, 15:51226 (J;US)
Review of defect chemistry of $LaMnO_3$ and $LaCrO_3$, 15:51212 (BA;US)
Solid oxide fuel cell interconnection materials based on $LaCrO_3$, 15:51035 (R;DK)
Synthesis of air sinterable lanthanum chromite powders, 15:51207 (BA;US)
Thermal expansion studies on cathode and interconnect oxide, 15:51210 (BA;US)
X-ray absorption studies of $YBa_2Cu_3O_{6+x}$, $La_{2-x}Sr_xCuO_4$, and $Nd_{2-x}Ce_xCuO_4$, 15:51217 (J;US)

LARYNX
Long-term study on the radiotherapy of squamous cell carcinomas confined to the vocal cord, 15:51798 (R;DE;In German)

LASER BEAM MACHINING
High power lasers and laser machining technology: Volume 1132, 15:51453 (B;US)

LASER CAVITIES
Intracavity second-harmonic generation in an alexandrite unidirectional ring laser, 15:51462 (BA;US)
Monolithic two-dimensional GaAs/AlGaAs laser arrays fabricated by chlorine ion-beam-assisted micromachining, 15:51435 (R;US)
Optically pumped fir lasers, 15:51470 (BA;US)

LASER FUSION REACTORS
See also CASCADE REACTORS
HYLIFE CONVERTER
Comparison of four concepts for an inertial-confinement-fusion power plant, 15:52551 (J;US)

LASER ISOTOPE SEPARATION
Microwave excitation of copper vapor plasmas: Final report, 15:50648 (R;US)

LASER MATERIALS
Enhancement of CW alexandrite laser performance, 15:51454 (BA;US)

LASER MIRRORS
Grazing incidence metal mirrors as the final elements in a laser driver for inertial confinement fusion, 15:52539 (R;US)

LASER RADIATION
Novel plasma-based frequency upshift methods for short pulse lasers, 15:51450 (R;US)
Semiconductor particle mediated photoelectron transfers in bilayer lipid membranes, 15:51264 (BA;US)

LASER SPECTROSCOPY
High power lasers and laser machining technology: Volume 1132, 15:51453 (B;US)

LASER TARGETS
Design of a neutron penumbral-aperture microscope with 10-μm resolution, 15:52534 (R;US)
Physical processes in femtosecond laser-target interactions, 15:52445 (BA;US)
Target physics results at 248 nm wavelength from the Aurora laser system high-intensity campaign, 15:52508 (R;US)

LASER WELDING
Experimental verification of physical model of pulsed laser welding, 15:51139 (R;US)
High power lasers and laser machining technology: Volume 1132, 15:51453 (B;US)

LASER-PRODUCED PLASMA
The dynamics of dense plasmas produced by ultra-short pulse lasers, 15:52449 (BA;US)
Very high power density subpicosecond laser for x-ray laser development, 15:52444 (BA;US)

Absorption Spectra
Absorption spectroscopy of a laser produced plasma, 15:52407 (BA;US)

Electric Conductivity
3D particle simulation on interaction of ultrashort laser pulse with solid density hydrogen plasma, 15:51981 (BA;US)

Parametric Instabilities
Laser driven instabilities in inertial confinement fusion, 15:52529 (R;US)

Performance
Flat response detectors from UV and x-ray region, 15:52433 (BA;US)

Plasma Density
Asymmetry of Stark-broadened Layman lines from laser-produced plasmas, 15:52405 (BA;US)

Plasma Diagnostics
Development of an x-ray framing camera, 15:52404 (BA;US)
Filtered x-ray diodes for imploding plasma experiments, 15:52379 (BA;US)
Green light (2ω) as an x-ray streak camera fiducial, 15:52402 (BA;US)
High energy x-ray microscopy with multilayer reflectors, 15:52399 (BA;US)
High intensity picosecond pulse interaction experiments, 15:52451 (BA;US)
Nova experimental facility, 15:52420 (BA;US)
Slitless intensified readout gated spectrometer, 15:52419 (BA;US)
Spectral shifting of intense femtosecond pulses during strong field ionization and plasma recombination, 15:51979 (BA;US)
Spectroscopic and interferometric measurements of laser-plasma produced blast waves, 15:52386 (BA;US)
Spectroscopic diagnostics of a copper laser-produced plasma produced by a line focus on a thin target, 15:52434 (BA;US)
X-ray spectroscopic methods for the diagnosis of laser imploded targets, 15:52398 (BA;US)

Plasma Heating
Ultrashort pulse laser heating of solids, 15:52446 (BA;US)

Spectroscopy
K-shell and L-shell plasma spectroscopy experiments: Final technical report, 15:51964 (R;US)

Wave Propagation
High energy density physics with subpicosecond laser pulses. 1989 technical digest series: Volume 17, 15:51452 (B;US)
The interaction of intense laser pulses in plasmas, 15:52453 (BA;US)

X-Ray Emission Analysis
Streak cameras capture x-ray laser emissions, 15:52470 (J;US)

X-Ray Spectra
Measurement of 0.1-3 KeV x-rays from laser plasmas, 15:52393 (BA;US)
Spectral measurements from laser-produced plasma in OMEGA, 15:52395 (BA;US)

MOESSBAUER EFFECT
Proceedings of 22. Zakopane school on physics, Zakopane, Poland, 1-15 May 1987. Part 2: Part 2. Condensed matter studies by nuclear methods, 15:52279 (R;PL)

MOLECULAR BIOLOGY
Research directors in DOE'S life science programs, 15:51801 (RA;US)
The requirements for improvement in biological microscopy, 15:51813 (RA;US)

MOLECULAR IONS
Dissociation dynamics: Measurements of decay fractions of metastable ammonia cluster ions, 15:51333 (J;US)
Enhanced electron-capture and charge variation of molecular ions, 15:52259 (RA;US)

MOLECULAR ORBITAL METHOD
Project for the development of a calculation system based on PC-compatible ordenators to be used on teaching and research on theoretical chemistry, 15:52582 (RA;BR;In Spanish)

MOLECULAR ORBITAL MODEL
See MOLECULES

MOLECULES
See also POLYATOMIC MOLECULES
A comparison of long distance electron and energy transfer, 15:51975 (BA;US)
Exciplex formation and electron transfer in polychromophoric systems, 15:51323 (BA;US)
Laser-induced phosphorescence spectroscopy in supersonic jets: The lowest triplet states of glyoxal, methyglyoxal, and biacetyl, 15:51969 (BA;US)
Measured radiaitive lifetimes for H_2 and HD in the E,F $^1\Sigma_g^+$ electronic state, 15:51967 (BA;US)
Rotational analysis of some vibronic bands in the $^3A_u \leftarrow {}^1A_g$ transition of Glyoxal: Spin splittings in the lowest triplet state of the isolated molecule, 15:51968 (BA;US)
Ultrasensitive fluorescence analysis in levitated microdroplets, 15:51766 (J;US)

MOLTEN CARBONATE FUEL CELLS
Cathode for molten carbonate fuel cell, 15:51043 (P;US)
Corrosion in fuel cells: An overview, 15:51036 (BA;US)
Doped cerium oxide for molten carbonate fuel cell cathodes: Final report, 15:51034 (R;US)

MOLYBDENUM
Bench-scale co-processing: Quarterly report No. 6, July 1, 1989–September 30, 1989, 15:50265 (R;US)
Bench-scale co-processing: Quarterly report No. 7, October 1, 1989–December 31, 1989, 15:50266 (R;US)
Bench-scale co-processing: Quarterly report No. 8, January 1, 1990–March 31, 1990, 15:50267 (R;US)
Catalytic functionalities of supported sulfides V. C-N bond hydrogenolysis selectivity as a function of promoter type, 15:50454 (J;US)
Effectiveness factors for hydroprocessing of coal and coal liquids: Progress report No. 11, March 16, 1990–June 15, 1990, 15:50269 (R;US)
Magnetic multilayer interface anisotropy: Technical progress report, August 1, 1990–December 31, 1990, 15:51127 (R;US)
Novel supports for coal liquefaction catalysts: Quarterly report No. 7, March 1, 1990–May 31, 1990, 15:50273 (R;US)
Reactive sputtering of molybdenum-oxide gradient-index filters, 15:51195 (R;US)

MOLYBDENUM 100 TARGET
Reply to "Comment on 'Monopole strength and shape coexistence in the $A \cong 100$ mass region' ", 15:52228 (J;US)

MOLYBDENUM ALLOYS
Helium effects on the mechanical properties of neutron-irradiated Cr-Mo ferritic steels, 15:52500 (R;US)
Thin films, composites, and superconducting junctions. Interim report, 1 October 1984-31 March 1985, 15:51120 (R;US)

MOLYBDENUM COMPLEXES
Synthesis of molybdenum imido alkylidene complexes and some reactions involving acyclic olefins, 15:51341 (J;US)

MOLYBDENUM COMPOUNDS
See also MOLYBDENUM NITRIDES
MOLYBDENUM OXIDES
A study of the activity and selectivity of molybdenum crystallographic shear compounds in the oxidation of C_4 hydrocarbons, 15:50455 (J;US)
Extraction of molybdenum VI by alpha benzoinoxime, 15:51309 (R;DZ;In French)

MOLYBDENUM NITRIDES
Characterization of NH_3 adsorbed on γ-Mo_2N by NMR spectroscopy, 15:50678 (J;US)

MOLYBDENUM OXIDES
Reactive sputtering of molybdenum-oxide gradient-index filters, 15:51195 (R;US)

MONITORING (BEAM)

Potential issues associated with shipping oil and gas through the Labrador Sea and Strait of Belle Isle, 15:51011 (R;CA)
Significant discoveries offshore Newfoundland and Labrador. Update 1988-03, 15:50401 (R;CA)
Use of a multi-reservoir simulation model for evaluating developments in the Bay d'Espoir system, 15:50682 (RA;CA)

NICKEL
Analysis of CO hydrogenation pathways using the bond-order-conservation method, 15:50301 (J;US)
Catalytic functionalities of supported sulfides V. C-N bond hydrogenolysis selectivity as a function of promoter type, 15:50454 (J;US)
Effectiveness factors for hydroprocessing of coal and coal liquids: Progress report No. 11, March 16, 1990–June 15, 1990, 15:50269 (R;US)
Improved anode catalysts for coal gas-fueled phosphoric acid fuel cells: Final report, 15:51033 (R;US)
Investigations of $Ni/NiCl_2$ electrodes in basic chloroaluminate melt, 15:50926 (BA;US)
Magnetic multilayer interface anisotropy: Technical progress report, August 1, 1990–December 31, 1990, 15:51127 (R;US)
Nanolayer reactions in aluminum-metal interfaces, 15:51145 (BA;US)
The application of glancing angle EXAFS to study the structure of platnum-nickel multilayers, 15:51153 (BA;US)

NICKEL 56
Reinvestigation of ^{56}Ni decay, 15:52179 (J;US)

NICKEL 58 TARGET
Two-proton correlations from the $^{58}Ni + {}^{58}Ni$ reaction at $E_{inc} \simeq$ 876.5 MeV, 15:52177 (R;US)

NICKEL ALLOYS
See also NICKEL BASE ALLOYS
A comparative study of iron-, nickel-, and cobalt-base weldments exposed in TVA 20-MW and Rocketdyne atmospheric fluidized bed combustors, 15:50359 (R;US)
A mathematical model for anomalous codeposition of nickel-iron on a rotating disk electrode, 15:51157 (BA;US)
The effect of pH on the nature and formation of the passive film on amorphous Ni-P-Cr alloys, 15:51159 (BA;US)

NICKEL BASE ALLOYS
See also HAYNES 188 ALLOY
A comparative study of iron-, nickel-, and cobalt-base weldments exposed in TVA 20-MW and Rocketdyne atmospheric fluidized bed combustors, 15:50359 (R;US)

NICKEL CHLORIDES
Investigations of $Ni/NiCl_2$ electrodes in basic chloroaluminate melt, 15:50926 (BA;US)

NICKEL OXIDES
The nickel oxide electrode: Structure and performance, 15:50920 (BA;US)

NICKEL-HYDROGEN BATTERIES
A nickel/hydrogen battery for PV systems, 15:50934 (J;US)

NIOBIUM
Thin films, composites, and superconducting junctions. Interim report, 1 October 1984-31 March 1985, 15:51120 (R;US)

NIOBIUM 93 TARGET
A new approach for precise measurements of keV neutron capture cross sections: The examples of ^{93}Nb, ^{103}Rh, and ^{181}Ta, 15:51585 (R;DE)

NIOBIUM ALLOYS
A comparative study of iron-, nickel-, and cobalt-base weldments exposed in TVA 20-MW and Rocketdyne atmospheric fluidized bed combustors, 15:50359 (R;US)
High-performance brittle matrices and brittle-matrix composites. Book 1. Final report, 15 March 1986-30 September 1989, 15:51117 (R;US)
High-performance brittle matrices and brittle-matrix composites. Book 2. Final report, 15 March 1986-30 September 1989, 15:51118 (R;US)

NIOBIUM CARBIDES
Electrodeposition of Cr-NbC composites from fused salt electrolyte, 15:51202 (BA;US)

NIPER
National Institute for Petroleum and Energy Research quarterly technical report, July 1–September 30, 1990: Volume 1, Fuels research, 15:50499 (R;US)

NITRIC OXIDE
Picosecond multiphoton ionization of atomic and molecular clusters, 15:51949 (R;US)
The use of wet limestone systems for combined removal of SO_2 and NO_x from flue gas, 15:50773 (R;US)
[Catalytic mechanism of hydrogenase from aerobic N_2-fixing microorganisms]: Progress report, 15:51775 (R;US)

NITROBENZENE
Measurements of toxic exhaust emissions from gasoline-powered light-duty vehicles. Final report, 15:51674 (R;US)
NITROGEN
Electron-excited molecules in nonequilibrium plasma, 15:52378 (B;US)
High-resolution Fourier transform spectroscopy: Line widths and line shapes of spectral lines emitted from helium and mixed-gas inductively coupled plasmas, 15:52455 (BA;US)
NITROGEN DIOXIDE
Effect of rangetop burner design on NO_2 emissions. Final report, February 1986-March 1987, 15:50519 (R;US)
Modelling NO_2 concentrations in a street canyon, 15:51645 (R;DK)
Recommended operating procedure No. 45: Analysis of nitrous oxide from combustion sources. Final report, September 1989-May 1990, 15:51660 (R;US)
NITROGEN IONS
Electron emission from collective excitation of solids by heavy ion impact, 15:52250 (RA;US)
NITROGEN ISOTOPES
Mound activities in chemical and physical research: January–December 1989, 15:51295 (R;US)
NITROGEN NITRIDES
See NITROGEN
NITROGEN OXIDES
See also NITRIC OXIDE
NITROGEN DIOXIDE
Evaluating the environmental impacts of the energy system: The ENPEP [ENergy and Power Evaluation Program] approach, 15:50937 (R;US)
Evaluation of water-injection impacts for gas-turbine NOx control at compressor stations. Topical report, June-September 1989, 15:50518 (R;US)
Laboratory evaluations of controlled combustion quenching and stratified exhaust-gas injection for NOx control on a four-stroke reciprocating engine. Topical report, May 1987-December 1988, 15:51110 (R;US)
Microwave induced catalytic destruction of some gaseous air pollutants, 15:51656 (RA;CA)
Proceedings: 1990 SO_2 control symposium: Volume 1: Sessions 1, 2, 3A, 3B, and 4A, 15:50768 (R;US)
Proceedings: 1990 SO_2 control symposium: Volume 2, Sessions 4B, 4C, 5, and 6A, 15:50769 (R;US)
Proceedings: 1990 SO_2 control symposium: Volume 3, Sessions 6B, 6C, 7A, 7B, and poster, 15:50770 (R;US)
Pulse combustion: The mechanisms of NOsub x production, 15:51425 (J;US)
Simultaneous particulates, NO_x, SO_x removal from flue gas by all solid-state electrochemical technology: Final report, July 15, 1987–January 31, 1990, 15:50763 (R;US)
The use of wet limestone systems for combined removal of SO_2 and NO_x from flue gas, 15:50773 (R;US)
NMR SPECTROMETERS
Low-field nuclear magnetic resonance with SQUID amplifiers, 15:51445 (RA;US)
NO. 2 FUEL OIL

PHOTONS
Photon scattering from the nucleon at LEGS, 15:52073 (BA;US)
Proceedings of the VIIth international workshop on photon-photon, 15:52028 (B;US)
Restrictions on gravitino mass from chiral scalar and pseudoscalar production, 15:52100 (J;US)
The CDF direct photon analysis, 15:52144 (BA;US)

PHOTONUCLEAR REACTIONS
The (γ, p) reaction in light nuclei at intermediate energies, 15:52174 (R;SE)

PHOTOPRODUCTION
Vector meson dominance and pointlike coupling of the photon in soft and hard processes, 15:52050 (R;DE)

PHOTOSYNTHETIC MEMBRANES
The structure and function of membrane protein photosynthetic reaction center, 15:51773 (R;US)

PHOTOSYNTHETIC REACTION CENTERS
Magnetic resonance studies of photosynthetic reaction centers and porphyrins: Final report, June 1, 1987–November 15, 1989, 15:50714 (R;US)
Multi-step electron transfer in rigid photosynthetic models at low temperature: Requirements for charge separation and spin-polarized radical ion pair formation, 15:50713 (R;US)
The structure and function of membrane protein photosynthetic reaction center, 15:51773 (R;US)

PHOTOVOLTAIC CELLS
See also SOLAR CELLS
Electronic processes in thin film PV materials: Final subcontract report, September 1, 1986–May 31, 1989, 15:50717 (R;US)
Health, safety and environmental issues relating to cadmium usage in photovoltaic energy systems, 15:50743 (R;US)
Novel thin-film $CuInSe_2$ fabrication: Final subcontract report, 15:50720 (R;US)

PHOTOVOLTAIC CONVERSION
Analysis of loss mechanisms in polycrystalline thin film solar cells: Final subcontract report, April 1, 1988–March 31, 1990, 15:50719 (R;US)
Photochemical energy conversion, 15:50721 (B;US)

PHOTOVOLTAIC POWER PLANTS
Repositioning: Photovoltaic (PV) industry's future, 15:50711 (J;US)

PHOTOVOLTAIC POWER SUPPLIES
Hybrid power system operational test results: Wind/PV/diesel system documentation, 15:50755 (BA;US)
Performance of amorphous silicon photovoltaic systems, 1985–1989, 15:50728 (R;US)
Repositioning: Photovoltaic (PV) industry's future, 15:50711 (J;US)

PHYSICAL PROPERTIES
Models for estimation of service life of concrete barriers in low-level radioactive waste disposal, 15:51254 (R;US)

PHYSICAL PROTECTION DEVICES
Physical security systems inspection tools and techniques, 15:50642 (R;US)

PHYSICS
See also HIGH ENERGY PHYSICS
NUCLEAR PHYSICS
SOLID STATE PHYSICS
Proceedings of 22. Zakopane school on physics, Zakopane, Poland, 1-15 May 1987. Part 2: Part 2. Condensed matter studies by nuclear methods, 15:52279 (R;PL)

PIGE ANALYSIS
See PROTON REACTIONS

PIGMENT CELLS

PINES
Explorations of mechanisms regulating ectomycorrhizal colonization of boron-fertilized pine: Quarterly report, October 1, 1990–December 31, 1990, 15:51839 (R;US)
Sigma Mesa: Background elemental concentrations in soil and vegetation, 1979, 15:51703 (R;US)

PION-NUCLEON INTERACTIONS
Experimental studies of nucleon-nucleon and pion-nucleus interactions at intermediate energies: Progress report, April 1, 1988–March 31, 1991, 15:52161 (R;US)
Pion double charge exchange scattering above the delta resonance, 15:52012 (R;US)
Pion double charge exchange scattering above the delta resonance, 15:52013 (R;US)

PIONIC ATOMS
Exotic atoms and leptonic conservations: Technical progress report, February 1, 1990–January 31, 1991, 15:51954 (R;US)
Sensitivity of deeply bound pionic atoms on the neutron skin, 15:51957 (R;JP)

PIONS
See also PIONS NEUTRAL
A dynamical model of pion photoproduction on nucleon in Δ-region, 15:52074 (BA;US)
Beam dynamics design of a pion linac, 15:51510 (R;US)
Color magnetism and delta photoproduction, 15:52138 (BA;US)
Field-theory calculations of the pion mass to one-loop order, 15:52154 (J;US)
Nuclear structure in delta and S11 resonance regions, 15:52042 (BA;US)
Peturbative gluon exchange in a covariant quark model of the pion, 15:52051 (R;US)
Status of AGS experiment 780, 15:51564 (BA;US)

PIONS NEUTRAL
Rare decays, 15:52022 (R;US)

PIPELINES
Accounting the seismic effect in NPP pipeline analysis, 15:50831 (RA;XA)
Environmental guidelines for the location, construction and operation of hydrocarbon pipelines in Ontario, 15:50497 (R;CA)
Evaluation of wildlife interactions with above-ground pipelines, 15:50543 (RA;CA)
Finding of no significant impact; Atlantic Richfield Company and Intalco Aluminum Corporation, 15:50517 (R;US)
H.R. 3092: Oil Pipeline Regulatory Reform Act of 1989. Introduced in the House of Representatives, One Hundredth First Congress, First Session, August 2, 1989, 15:50493 (B;US)
Piping seismic fragility tests, 15:50834 (RA;XA)
Seismic analysis method of MONJU liquid metal pipings and verification with seismic tests on model pipings, 15:50833 (RA;XA)
Seismic qualification of piping systems based on strain criteria, 15:50832 (RA;XA)
Transport of heavy crude oil by water-continuous emulsions, 15:50495 (RA;CA)

PIPES
Bondings for tubular solar collectors, 15:50741 (R;XA)
Nondestructive examination (NDE) reliability for inservice inspection of light water reactors: Semi-annual report, October 1988–March 1989, 15:50781 (R;US)

PLANCK RADIATION FORMULA
Spectra from a cooling/warming blackbody, 15:52411 (BA;US)

PLANT GROWTH
Leaf exsertion, leaf elongation, and leaf senescence in Eriophorum vaginatum and Carex Bigelowii: Final report, 15:51696 (R;US)

PLANTS

PLASMA
See also COLLISIONAL PLASMA
COLLISIONLESS PLASMA
HOT PLASMA
LASER-PRODUCED PLASMA
NON-EQUILIBRIUM PLASMA
RELATIVISTIC PLASMA
ROTATING PLASMA
SOLID-STATE PLASMA
Effective γ x-ray excitation rates for plasma imputity measurements, 15:52408 (BA;US)
Evaluation of soft x-ray average recombination coefficient and average charge for metallic impurities in beam heated plasmas, 15:52441 (BA;US)
High resolution shock-capturing scheme for numerical simulation of plasma-shock interaction, 15:52365 (R;DE)
Ion temperatures and poloidal rotation in Alcator C plasmas, 15:52382 (BA;US)
Laboratory experiments on the magnetic field and neutral density limits on CIV interaction, 15:52376 (R;SE)
Multiple-use plasma laboratory for graduate fusion education, 15:52468 (J;US)
Phenomenology, diagnostics, and non-LTE effects in plasma-particle interactions, 15:52005 (RA;US)
Potential drops supported by ion density cavities in the dynamic response of a plasma diode to an applied field, 15:51943 (R;SE)
Probes for edge plasma studies of TFTR, 15:52397 (BA;US)
Spectral shifting of intense femtosecond pulses during strong field ionization and plasma recombination, 15:51979 (BA;US)
The TFTR Mirnov loop system, 15:52549 (BA;US)
Toroidal variation of power radiated from TFTR, 15:52443 (BA;US)
Transport of long-pulse, high-current electron beams in preformed monatomic plasma channels in the ions focus regime, 15:52495 (J;US)
Turbulent enhancement of particle and heat fluxes during sawtooth oscillations in a tokamak edge plasma, 15:52493 (J;US)

PLASMA (QUARK)
See QUARK MATTER

PLASMA ARC SPRAYING
The measurement of single particle temperature in plasma sprays, 15:51177 (RA;US)

PLASMA ARC WELDING
Phenomenology, diagnostics, and non-LTE effects in plasma-particle interactions, 15:52005 (RA;US)

PLASMA CONFINEMENT
See also MAGNETIC CONFINEMENT
X-ray diagnostics for magnetic fusion, 15:52423 (BA;US)

PLASMA DENSITY
Escape factors for Stark-broadened line profiles, 15:52406 (BA;US)

PLASMA DIAGNOSTICS
A large field, 200-psec gated microchannel plate detector, 15:52394 (BA;US)
A system for laser injection of tracer elements into TFTR plasmas, 15:52436 (BA;US)
Absorption spectroscopy of a laser produced plasma, 15:52407 (BA;US)
Asymmetry of Stark-broadened Layman lines from laser-produced plasmas, 15:52405 (BA;US)
Deconvolution of H-alpha profiles measured by Thompson scattering collecting optics, 15:52381 (BA;US)
Electron-excited molecules in nonequilibrium plasma, 15:52378 (B;US)
Escape factors for Stark-broadened line profiles, 15:52406 (BA;US)
Filtered x-ray diodes for imploding plasma experiments, 15:52379 (BA;US)
High-resolution Fourier transform spectroscopy: Line widths and line shapes of spectral lines emitted from helium and mixed-gas inductively coupled plasmas, 15:52455 (BA;US)
Initial comparison of TFTR neutral species measurements, 15:52412 (BA;US)

Neutral-beam performance analysis using a CCD camera, 15:52415 (BA;US)
Operation of multi-channel tangential bolometer on PBX, 15:52418 (BA;US)
Optically pumped fir lasers, 15:51470 (BA;US)
Photoconductor x-ray detectors and bolometers, 15:52438 (BA;US)
Pyroelectric x-ray detectors and x-ray pyrometers, 15:52440 (BA;US)
Radial and tangential scanning of the hard x-ray Bremsstrahlung emission from tokamak plasmas, 15:52439 (BA;US)
Spectral measurements from laser-produced plasma in OMEGA, 15:52395 (BA;US)
The TFTR diagnostic natural beam, 15:52392 (BA;US)

Bolometers
Analysis of highly asymmetric radiation loss profiles in TFTR, 15:52435 (BA;US)
Toroidal variation of power radiated from TFTR, 15:52443 (BA;US)

Computerized Control Systems
An arc facility for investigating non-LTE thermodynamic and transport phenomena in low and high pressure plasmas, 15:52427 (BA;US)

Data Acquisition
Nova experimental facility, 15:52420 (BA;US)

Emission Spectra
Some non-LTE diagnostic methods for hydrogen plasmas, 15:52429 (BA;US)

Fabry-Perot Interferometer
Ion temperature profile measurements using the far line wings of Hα, 15:52454 (BA;US)

Faraday Cups
Diagnostic system for measurement of particle balance in TMX-U, 15:52422 (BA;US)
High intensity lithium beam for Zeeman spectroscopy, 15:52387 (BA;US)

Fiber Optics
Fiber optic current sensor with Heterodyne detection, 15:52424 (BA;US)

Infrared Spectrometers
The study of the detached plasma regime in TFTR using the MIRI far infrared interferometer, 15:52430 (BA;US)

Interferometry
Two-dimensional tokamak density distribution measurements using phase-imaging interferometry, 15:52442 (BA;US)

Langmuir Probe
Probes for edge plasma studies of TFTR, 15:52397 (BA;US)
Turbulent enhancement of particle and heat fluxes during saw-tooth oscillations in a tokamak edge plasma, 15:52493 (J;US)

Microchannel Electron Multipliers
Ion temperatures and poloidal rotation in Alcator C plasmas, 15:52382 (BA;US)

Microwave Amplifiers
Development of gyrotrons for plasma diagnostics, 15:52421 (BA;US)

Modifications
Plasma diagnostics for the DIII-D divertor upgrade, 15:52356 (R;US)

Neutron Sources
High-yield direct drive experiments at Nova, 15:52390 (BA;US)

Optical Reflection
Simple models of pinhole closure in high-energy-density experiments, 15:52400 (BA;US)

Photodiodes
Measurement of 0.1-3 KeV x-rays from laser plasmas, 15:52393 (BA;US)

Scintillator-Photodiode Detectors
The JET soft x-ray diode array diagnostic, 15:52384 (BA;US)

SI Semiconductor Detectors
Diagnostic applications of the TFTR XIS system, 15:52396 (BA;US)

Spectrometers
CHERS: Charge exchange recombination spectrometer for ion temperature measurement on TFTR, 15:52432 (BA;US)
Proceedings of the 6th topical conference on high temperature plasma diagnostics, 15:52377 (B;US)
Slitless intensified readout gated spectrometer, 15:52419 (BA;US)
Space and time resolving spectrograph for fusion plasma diagnostics, 15:52416 (BA;US)

Spectroscopy
A novel scanning method for tokamak spectroscopy, 15:52428 (BA;US)
An atmospheric arc facility to study the non LTE plasma properties of a magnetically rotated electric arc, 15:52425 (BA;US)
Multichordal charge exchange recombination spectroscopy on the D3-D tokamak, 15:52431 (BA;US)
Plasma density and poloidal field measurements on text using an injected lithium beam, 15:52380 (BA;US)
Spectroscopic and interferometric measurements of laser-plasma produced blast waves, 15:52386 (BA;US)
Time resolved spectra in the 80-330 A wavelength region from PLT tokamak plasmas., 15:52417 (BA;US)

Streak Cameras
Development of an x-ray framing camera, 15:52404 (BA;US)
Optical and uv/x-ray imaging diagnostics for imploding foil experiments, 15:52437 (BA;US)
Optical fiducials for x-ray streak cameras at LLE, 15:52401 (BA;US)
Radiaton diagnostics for x-ray laser experiments on Proto II, 15:52388 (BA;US)
Resolution characteristics of Lawrence Livermore National Laboratory soft x-ray streak cameras, 15:52403 (BA;US)
Soft x-ray and visible imaging systems for measurement of non-circular tokamak plasmas in PHX, 15:52426 (BA;US)
Streak cameras capture x-ray laser emissions, 15:52470 (J;US)
Studies of subnanosecond x-ray switching and shuttering techniques, 15:52391 (BA;US)
The TFTR vertical x-ray imaging system, 15:52385 (BA;US)

Ultraviolet Spectrometers
Effective γ x-ray excitation rates for plasma imputity measurements, 15:52408 (BA;US)

X-Ray Equipment
High energy x-ray microscopy with multilayer reflectors, 15:52399 (BA;US)

X-Ray Spectra
Observations of centrally peaked impurity profiles in the Alcator-C tokamak following pellet injection, 15:52409 (BA;US)

X-Ray Spectrometers
Neutral hydrogen density and electron temperature measurements from Rydberg series of He-and H-like argon in the Alcator C tokamak, 15:52410 (BA;US)
Vertical high resolution Bragg x-ray spectrometer for the Tokamak fusion test reactor, 15:52414 (BA;US)

X-Ray Spectroscopy
Spectroscopic diagnostics of a copper laser-produced plasma produced by a line focus on a thin target, 15:52434 (BA;US)
X-ray diagnostics for magnetic fusion, 15:52423 (BA;US)
X-ray spectroscopic methods for the diagnosis of laser imploded targets, 15:52398 (BA;US)

PLASMA FOCUS DEVICES
Status of the plasma focus source for the laboratory type imaging microscope, 15:51818 (RA;US)

PLASMA HEATING
See also BEAM INJECTION HEATING
Modeling of induction-linac based free-electron laser amplifiers, 15:51456 (BA;US)

PLASMA MICROINSTABILITIES
Partially linearized algorithms in gyrokinetic particle simulation, 15:52372 (R;US)

PLASMA OSCILLATIONS
See PLASMA WAVES

PLASMA PRODUCTION
An arc facility for investigating non-LTE thermodynamic and transport phenomena in low and high pressure plasmas, 15:52427 (BA;US)

Multiphoton ionization rates for atomic hydrogen: Solutions of Schrodinger equation compared with model values, 15:51978 (BA;US)
Physical processes in femtosecond laser-target interactions, 15:52445 (BA;US)
Ultra-high intensity lasers and experiments at Los Alamos, 15:52450 (BA;US)

PLASMA SIMULATION
Partially linearized algorithms in gyrokinetic particle simulation, 15:52372 (R;US)

PLASMA WAVES
Acceleration of charged particles by plasma oscillations in laminated plasma, 15:52367 (R;UA;In Russian)
Analytic expression for mode conversion of electrostatic and electromagnetic waves, 15:52484 (J;US)
Concepts in strong Langmuir turbulence theory, 15:52006 (R;US)

PLASMOIDS
Simulation and theory of radial equilibrium of plasmoid propagation: Final report, 15:52007 (R;US)

PLATINUM
Analysis of CO hydrogenation pathways using the bond-order-conservation method, 15:50301 (J;US)
Application of the hanging meniscus rotating disk electrode method to O_2 reduction of platinum in H_3PO_4, 15:51349 (BA;US)
Catalytic functionalities of supported sulfides V. C-N bond hydrogenolysis selectivity as a function of promoter type, 15:50454 (J;US)
Coupled catalytic oscillators: CO oxidation over polycrystalline Pt, 15:51330 (J;US)
Improved anode catalysts for coal gas-fueled phosphoric acid fuel cells: Final report, 15:51033 (R;US)
Metal-support effects on acetone hydrogenation over platinum catalysts, 15:50298 (J;US)
Photosynthetic water splitting, 15:50658 (BA;US)
The application of glancing angle EXAFS to study the structure of platnum-nickel multilayers, 15:51153 (BA;US)

PLATINUM ALLOYS
A comparison of electrocatalytic and microstructural properties in platinum and platinum-chromium dispersed catalysts, 15:51146 (BA;US)
Application of the hanging meniscus rotating disk electrode method to O_2 reduction of platinum in H_3PO_4, 15:51349 (BA;US)

PLESIOTHERAPY
See RADIOTHERAPY

PLT DEVICES
Time resolved spectra in the 80-330 A wavelength region from PLT tokamak plasmas., 15:52417 (BA;US)
Use of graphite in Langmuir-calorimeter probe heads, 15:52548 (BA;US)

PLUTONIUM
Aqueous processing of actinides at Savannah River, 15:50621 (R;US)
Fabrication of neptunium, plutonium, americium and curium metals for fuel research: Review report, 15:51371 (R;JP;In Japanese)
Magnetic structures of actinide materials by pulsed neutron diffraction, 15:51130 (R;US)
Measurement uncertainty estimates for reprocessing facilities, 15:50553 (R;US)
New strategy for minor actinides partitioning preliminary results on the electrovolatilization of ruthenium and on the stabilization of Am(IV) in nitric acid with phosphotunsgstate ligand, 15:50550 (R;FR)
Transport of actinides and Tc through a bentonite backfill containing small quantities of iron, copper or minerals in inert atmosphere, 15:51715 (R;SE)

PLUTONIUM ALLOYS
Aqueous processing of actinides at Savannah River, 15:50621 (R;US)

PLUTONIUM COMPLEXES
Transuranic organometallics: The next generation, 15:51310 (R;US)

PLUTONIUM FLUORIDES
Magnetic and optical properties of Np and Pu ions and compounds, 15:51253 (R;US)

PLUTONIUM ISOTOPES
Multiple Group Analysis (MGA): A gamma-ray spectrum analysis code for determining plutonium isotopic abundances: Volume 2, A guide to using MGA, 15:51373 (R;US)

PLUTONIUM OXIDES
An incinerator ash dissolution model for the system: plutonium oxide, nitric and hydrofluoric acids, 15:50554 (J;US)

PMMA
Diblock copolymers at surfaces, 15:51301 (BA;US)

SCINTISCANNING
Pediatric cardiovascular nuclear medicine, 15:51828 (BA;US)

SEA BED
The long-term measurement of strong-motion earthquakes offshore southern California, 15:51893 (BA;US)

SEAS
Five year research plan, 1990-1994, 15:51736 (R;CA)

SEASONAL THERMAL ENERGY STORAGE
A borehole heat store in rock at the University of Luleaa: The Lulevaerme project 1982-1988, 15:50912 (R;SE)
Central solar heating plants with seasonal storage: Final report on IEA Task 7, 15:50731 (R;US)
The Danish aquifer thermal-energy storage project: Demonstration plant. Operational experiences and results, 15:50914 (R;DK)

SEASONAL VARIATIONS
Wetlands mapping with spot multispectral scanner data, 15:51729 (R;US)

SEAWATER
Development of models for use in the assessment of waste repository performance: Annual progress report, November 1, 1988–September 30, 1989, 15:50614 (R;US)

SECONDARY BATTERIES
See ELECTRIC BATTERIES

SECONDARY RECOVERY
See ENHANCED RECOVERY

SEDIMENTS
A feasibility study of modeling pedogenic carbonates in soils and sediments at the US Department of Energy's Hanford Site, 15:50603 (R;US)
Health assessment for Potter's Septic Tank Service Pits, Maco, Brunswick County, North Carolina, Region 4. CERCLIS No. NCD981023260. Preliminary report, 15:51754 (R;US)
Health assessment for Savage Municipal Well, Milford, Hillsborough County, New Hampshire, Region 1. CERCLIS No. NHD980671002 (amended). Preliminary report (Final), 15:51746 (R;US)
Installation-Restoration Program Stage 5. Informal technical information report, analytical data summary. Preliminary pathways assessment - surface-water and stream-sediment samples. Final report, January 1989-March 1990, 15:51722 (R;US)
Persistence and distribution of PCBs in the sediments of a reservoir (Lake Hartwell, South Carolina), 15:51721 (J;US)
Settling velocity measurements of mud flocs in the river Ems, comparison with measurements in the river Elbe, 15:51733 (R;DE;In German)
The settling velocity of suspended solid matter in the river Elbe at Lauenburg and Bunthaus, August 1989, 15:51732 (R;DE;In German)

SEEDS
Optimization of surface sterilization for legume seed, 15:51875 (J;US)

SEISMIC EFFECTS
An overview of the U.S. Department of Energy's program for liquid metal reactor seismic technology, 15:50802 (RA;XA)
Analysis of the dynamic behaviour of the PEC shutdown system. Pt. 1. Experimental tests; Pt. 2. Validation of the numerical analysis, 15:50821 (RA;XA)
Approach to LMFBR floor response reduction, 15:50813 (RA;XA)
Dynamic analysis of the PEC fast reactor vessel: On-site tests and mathematical models, 15:50828 (RA;XA)
Seismic isolation systems with distinct multiple frequencies, 15:51082 (P;US)
Status report on R and D for seismic analysis of FBR structures in France, 15:50797 (RA;XA)

SEISMIC EVENTS
See also EARTHQUAKES
Seismic issues at the Paducah Gaseous Diffusion Plant, 15:51885 (R;US)

SEISMIC ISOLATION
The benefits and problems of base seismic isolation for LMFBR reactor plants, 15:50812 (RA;XA)
U.K. base seismic isolation systems, design studies and R and D programme, 15:50814 (RA;XA)

SEM (MICROSCOPY)
See SCANNING ELECTRON MICROSCOPY

SEMICONDUCTOR COUNTERS
See SEMICONDUCTOR DETECTORS

SEMICONDUCTOR DETECTORS
See also LI-DRIFTED DETECTORS
SI SEMICONDUCTOR DETECTORS
Flat response detectors from UV and x-ray region, 15:52433 (BA;US)

SEMICONDUCTOR DEVICES

SEMICONDUCTOR RESISTORS
TRANSISTORS
MUSE - a systolic array for adaptive nulling with 64 degrees of freedom, using Givens transformations and wafer-scale integration. Technical report, 15:52570 (R;US)
Semiconductor heterojunction device with graded bandgap, 15:51487 (P;US)

SEMICONDUCTOR LASERS
Application of diode lasers to resonance ionization mass spectrometry, 15:51285 (R;US)
Channel-width tailoring of index-guided arrays, 15:51469 (BA;US)
High-power hybrid two-dimensional surface-emitting AlGaAs diode laser arrays, 15:51436 (R;US)
Highly stable strained layer leaky-mode diode laser arrays, 15:51478 (J;US)
Monolithic two-dimensional GaAs/AlGaAs laser arrays fabricated by chlorine ion-beam-assisted micromachining, 15:51435 (R;US)
Surface-emitting lasers with periodic gain, 15:51459 (BA;US)
Wavelength-resonant, surface-emitting semiconductor laser: A novel quantum optical structure, 15:51460 (BA;US)

SEMICONDUCTOR MATERIALS
See also N-TYPE CONDUCTORS
Thiol surface complexation on growing CdS clusters, 15:51280 (J;US)

Defects
Pressure dependence of defect centers at the (111) Si/SiO_2 interface, 15:51248 (RA;US)

Electrical Properties
Time-resolved spectroscopies in solids, 15:51251 (RA;US)

Electronic Structure
Theoretical studies of the electronic properties of solid surfaces, 15:51250 (RA;US)

Excitation Systems
Time-resolved spectroscopies in solids, 15:51251 (RA;US)

Grain Boundaries
Intrinsic instability and entropy stabilization of grain boundaries, 15:51272 (J;US)

Image Processing
XUV free-electron laser-based projection lithography systems, 15:52289 (R;US)
Interactions
High energy and heavy ion beams in materials analysis, 15:51966 (B;US)
Interfaces
Simulation and quantification of high-resolution Z-contrast imaging of semiconductor interfaces, 15:51268 (BA;US)
Magnetic Properties
Theoretical studies of the electronic properties of solid surfaces, 15:51250 (RA;US)
Mathematical Models
Theoretical studies of the electronic properties of solid surfaces, 15:51250 (RA;US)
Optical Properties
Time-resolved spectroscopies in solids, 15:51251 (RA;US)
Particle Interactions
Time-resolved spectroscopies in solids, 15:51251 (RA;US)
Physical Properties
Electronic processes in thin film PV materials: Final subcontract report, September 1, 1986–May 31, 1989, 15:50717 (R;US)
Schottky Effect
Pressure dependence of Schottky barrier at the Pt/GaAs interface, 15:51247 (RA;US)
Spectroscopy
Surface vibrational spectroscopy of molecular adsorbates on metals and semiconductors by infrared-visible SFG, 15:51132 (RA;US)
Structure-Activity Relationships
Theoretical studies of the electronic properties of solid surfaces, 15:51250 (RA;US)
Surface Properties
Optical second-harmonic generation as a surface probe for noncentrosymmetric media, 15:52293 (RA;US)
Scanning tunneling microscopy of semiconductor surfaces. Final report, 1 April 1987-30 September 1989, 15:51233 (R;US)
Surface vibrational spectroscopy of molecular adsorbates on metals and semiconductors by infrared-visible SFG, 15:51132 (RA;US)
Theoretical studies of the electronic properties of solid surfaces, 15:51250 (RA;US)
Thermodynamic Properties
Intrinsic instability and entropy stabilization of grain boundaries, 15:51272 (J;US)

SEMICONDUCTOR RESISTORS
Fundamental research on metal oxide varistor technology: Final report, 15:50892 (R;US)

SEMINAL VESICLES
See MALE GENITALS

SENIOR CENTERS
See PUBLIC BUILDINGS

SEPARATION PROCESSES
See also FLOTATION
ORE ENRICHMENT
Mound activities in chemical and physical research: January–December 1989, 15:51295 (R;US)

SEWAGE SLUDGE
Effect of recycling thermophilic sludge on the activated-sludge process. Report for October 1984-June 1989, 15:51094 (R;US)

SHAFT EXCAVATIONS
Exploratory Shaft Seismic Design Basis Working Group report: Yucca Mountain Project, 15:50606 (R;US)
Simulation of heat transfer in the unsaturated zone, 15:50632 (BA;US)

SHALE OIL
Kinetic simulation model for steam pyrolysis of shale oil feedstock, 15:50536 (J;US)

SHEAR
Particle dispersion by vortex structures in free shear flows, 15:51401 (RA;US)

SHEARER LOADERS
Development of a pickforce steering system, 15:50340 (R;XE)

SHEATHS (FUEL)
See FUEL CANS

SHEEP
Kootenai River wildlife habitat enhancement project: Long-term bighorn sheep/mule deer winter and spring habitat improvement project, 15:50698 (R;US)
Ural-tweed bighorn sheep wildlife mitigation project: Final completion report, 15:51695 (R;US)

SHOCK ABSORBERS
Evaluation of uniaxial and triaxial shock isolation techniques for a piezoresistive accelerometer, 15:51616 (R;US)

SHOCK WAVES
Attenuation studies of booster-rocket propellants and their simulants, 15:51256 (R;US)
Infrared spectroscopy and mapping of IC443, 15:51931 (BA;US)

SHORT ROTATION CULTIVATION
Energy forests, energy crops and straw, 15:50663 (R;SE;In Swedish)

SHOWER COUNTERS
Hadron and electron response of uranium/liquid argon calorimeter modules for the D0 detector, 15:51597 (BA;US)
Initial data from the Soudan 2 experiment, 15:52011 (R;US)
The CDF direct photon analysis, 15:52144 (BA;US)

SHRIMP
Concentrations of selected chlorinated pesticides in shrimp collected from the Calcasieu River/Lake Complex, Louisiana, 15:51874 (J;US)

SHUTDOWN (REACTOR)
See REACTOR SHUTDOWN

SHUTIN PRESSURE
See RESERVOIR PRESSURE

SI SEMICONDUCTOR DETECTORS
Application of Pd silicide in the process of silicon detectors, 15:51598 (J;US)

SIALON

SIGMA MODEL
Holonomy anomalies, 15:52136 (BA;US)

SIGMA-410 RESONANCES
See SIGMA MODEL

SILANES
Variational spectroscopy of a silane monolayer at air/solid and liquid/solid interfaces using sum-frequency generation, 15:51243 (RA;US)

SILICA
Infrared reflectance measurement of ion inplanted silica, 15:51263 (BA;US)
Scattering from gas-phase synthesized particles, 15:51261 (BA;US)
Structure of microphase-separated silica/siloxane molecular composites, 15:51199 (BA;US)

SILICATES
See also SODIUM SILICATES
Structural and dynamical properties of the sol-gel transition, 15:51279 (J;US)

SILICEOUS ROCK
See SANDSTONES

SILICON
An analytic representation of the radial distribution of dose from energetic heavy ions in water, Si, LiF, and NaI, 15:52266 (RA;US)
Cherenkov x rays: Recent experimental results, 15:52255 (RA;US)
Evidence against surface nucleation following pulsed melting of Si, 15:51275 (J;US)
Hydrogen and deuterium profiling in polymers using light and heavy ion elastic recoil detection, 15:51973 (BA;US)
Radiative electron capture [REC], 15:52256 (RA;US)
Studies of subnanosecond x-ray switching and shuttering techniques, 15:52391 (BA;US)

Two semiempirical expressions for condensed-phase heat capacities, 15:52306 (J;US)

SILICON ALLOYS
High-performance brittle matrices and brittle-matrix composites. Book 1. Final report, 15 March 1986-30 September 1989, 15:51117 (R;US)
High-performance brittle matrices and brittle-matrix composites. Book 2. Final report, 15 March 1986-30 September 1989, 15:51118 (R;US)

SILICON CARBIDES
Creep of Hot-Pressed SiC Whisker Reinforced Mullite, 15:51204 (BA;US)

SILICON COMPOUNDS
See also SILANES
SILICATES
SILICON CARBIDES
SILICON NITRIDES
SILICON OXIDES
Chemical characterization of the surface sites of coal: Technical progress report, October--December 1989, 15:50311 (R;US)
Gaussian-1 theory of molecular energies for second-row compounds, 15:52003 (J;US)

SILICON HYDRIDES
See SILANES

SILICON NITRIDES
Gelcasting of sub-micron alumina, sialon, and silicon nitride powders, 15:51181 (R;US)

SILICON OXIDES

Monte Carlo study of the transient expansion of photogenerated plasmas in bulk semiconductors: Nonequilibrium phonon effects, 15:52239 (R;US)

SOLIDS
Berry phases and Wyckoff positions for energy bands in solids, 15:52269 (R;US)
Comparison of multiphoton and collisional ionization in high intensity laser-plasma interactions, 15:52448 (BA;US)
Development and utilization of new diagnostics for dense-phase pneumatic transport: Quarterly technical progress report, April 1, 1990–June 30, 1990, 15:50358 (R;US)
Electronic excitations in fast ion-solid collisions, 15:52271 (R;US)
Mechanism of H_n^+ and H^- desorption during fast ion bombardment, 15:52262 (RA;US)
Phase Hamiltonian and depinning electric field in the charge-density wave and the spin-density wave, 15:52303 (J;US)
Removal of total dissolved solids from oilfield produced water using electrodialysis, 15:50542 (RA;CA)
Review of convoy electron phenomena, 15:52248 (RA;US)
Simulations of intense laser beams interacting with gases and solids, 15:51977 (BA;US)
Space correlations at radiation-defect storage and aggregation in solids, 15:52288 (R;SU;In Russian)
Spectral densities of the symmetric Anderson model, 15:52301 (J;US)
Sputtering by fast ions using a sum of impulses, 15:52260 (RA;US)
The development of projectile excitation during ion-solid collisions observed through convoy electron emission, 15:52270 (R;US)
Transport theory for convoy electrons and Rydberg electrons in solids, 15:52249 (RA;US)
Two semiempirical expressions for condensed-phase heat capacities, 15:52306 (J;US)
Ultrashort pulse laser heating of solids, 15:52446 (BA;US)

SOLITONS
Soliton model for elementary electric charge, 15:52106 (R;UA)

SOLUTIONS
Monte Carlo simulations of hydrophobic polyelectrolytes. Evidence for a structural transition in response to increasing chain ionization, 15:52004 (J;US)

SOLVENT EXTRACTION
Solvent extraction of South Island lignites: separation and characterisation of some organic chemical components, 15:50293 (R;NZ)

SOLVENT-REFINED COAL
Low-rank coal structure from low-severity products, 15:50322 (RA;US)

SOLVENTS
Guides to pollution prevention: The printed-circuit-board manufacturing industry, 15:51747 (R;US)

SONIC MEASUREMENTS
See ACOUSTIC MEASUREMENTS

SOOT
Fuel structure and pressure effects on the formation of soot particles in diffusion flames. Annual report, 15 January 1989-15 January 1990, 15:51374 (R;US)

SORBENT INJECTION PROCESSES
Global approach for enhanced mass transfer effects in-duct flue gas desulfurization processes: Work plan: Volume 1, Literature review, 15:50766 (R;US)
Global approach for enhanced mass transfer effects in-duct flue gas desulfurization processes: Work plan: Volume 2, Test plan and schedule, 15:50765 (R;US)
Global approach for enhanced mass transfer effects in-duct flue gas desulfurization processes: Work plan: Volume 1, Literature review, 15:50764 (R;US)
Global approach for enhanced mass transfer effects: In-duct injection FGD processes: Topical report No. 1, Experimental studies, 15:50767 (R;US)

SORPTION
Effects of mineralogy on the sorption of strontium and cesium onto Calico Hills tuff, 15:50563 (R;US)

SOUND
See SOUND WAVES

SOUND WAVES
See also ULTRASONIC WAVES
Pairwise interactions and attenuation of sound in bubbly liquids, 15:51412 (RA;US)

SOUR CRUDES
Sour gas technology in the 1990's, 15:50382 (RA;CA)

SOUTH CAROLINA
Site Enforcement Tracking System (SETS): PRP listing by site for South Carolina, 15:50967 (R;US)

SOUTH KOREA
See REPUBLIC OF KOREA

SOVIET UNION
See USSR

SPACE HEATING
Energy retrofitting of older residential buildings with emphasis on utilization of opaque insulation materials, 15:50733 (R;DK;In Danish)

SPACE POWER REACTORS
A survey of control rod measurements in ZPPR and their analysis, 15:50848 (RA;AT)

SPACE-TIME
Centrifugal force in Ernst spacetime, 15:52336 (R;XA)
On the Schwinger-De Witt expansion for the Feynman propagator in a curved space-time, 15:52348 (RA;DD)
Space-time dimension of the universe, 15:52339 (R;JP)

SPALLATION
Intermittency in nuclear multifragmentation, 15:52207 (R;DE)

SPALLATION FRAGMENTS
Angular correlations and fragmentation in intermediate energy heavy ion collisions, 15:51962 (R;SE)

SPALLATION PRODUCTS
See SPALLATION FRAGMENTS

SPARTICLES
On the supersymmetric generalizations of the action of relativistic massless particles, 15:52061 (R;UA;In Russian)
On the twistor representation of Siegel transformation for superparticles, 15:52062 (R;UA;In Russian)

SPECTRA (NEUTRON)
See NEUTRON SPECTRA

SPECTRAL FUNCTIONS
A user's guide to subroutine SPDNSF [Spectral Density Function], 15:52577 (RA;US)

SPECTROMETERS
See also FOURIER TRANSFORM SPECTROMETERS
INFRARED SPECTROMETERS
NMR SPECTROMETERS
X-RAY SPECTROMETERS
Proceedings of the 6th topical conference on high temperature plasma diagnostics, 15:52377 (B;US)
Slitless intensified readout gated spectrometer, 15:52419 (BA;US)

Space and time resolving spectrograph for fusion plasma diagnostics, 15:52416 (BA;US)

SPECTROSCOPY
See also GAMMA SPECTROSCOPY
LASER SPECTROSCOPY
MASS SPECTROSCOPY
X-RAY SPECTROSCOPY
Multichordal charge exchange recombination spectroscopy on the D3-D tokamak, 15:52431 (BA;US)

SPEECH
Improving risk communication through interactive training in communication skills, 15:50939 (R;US)

SPENT FUEL CASKS
KE/KW Operations Standardization and Water System Upgrades Program: Program plan: Revision 1, 15:50556 (R;US)
The role of sensor directed, model-based control in robotic handling of nuclear waste casks and materials, 15:50557 (BA;US)

SPENT FUEL STORAGE
A critical judgement of the SKB evaluation and assessment of the WP-Cave concept as accounted for in SKB Technical Reports 89-20 and 89-26, 15:50610 (R;SE;In Swedish)

SPENT FUELS
Rejuvenation of CANDU [Canada deuterium uranium] spent fuel in a hybrid blanket, 15:52552 (J;US)
US DOE-AECL cooperative program for development of high-level radioactive waste container fabrication, closure, and inspection techniques, 15:50615 (R;US)
Use of performance assessment in assessing compliance with the containment requirements in 40 CFR Part 191, 15:50601 (R;US)

SPENT SHALES
Characterization of volatile organic components in spent shale, 15:50538 (R;US)

SPIN-OFF
See TECHNOLOGY TRANSFER

SPINELS
Optimum catalytic process for alcohol fuels from syngas: Thirteenth quarterly technical progress report, January–March 1990, 15:50275 (R;US)

SPONTANEOUS COMBUSTION
Suppression methods for deep-seated coal fires. Final report, 15:50354 (R;US)

SPONTANEOUS FISSION
Bimodal fission, 15:52201 (RA;PL)

SPUTTERING
Simulation of sputtering of multicomponent solids by ion bombardment: program system PERST, 15:52285 (R;UA;In Russian)

SQUID DEVICES
Flux noise in thin films, 15:51249 (RA;US)
Hot-electron effect in the dc SQUID, 15:51582 (RA;US)
Low-field nuclear magnetic resonance with SQUID amplifiers, 15:51445 (RA;US)
Superconductivity, superconducting devices, and 1/f noise, 15:51444 (RA;US)

STAINLESS STEEL-18-4-1
See STAINLESS STEELS

STAINLESS STEEL-19-9DL
See STAINLESS STEELS

STAINLESS STEEL-304
Coal ash deposition and interaction with metal substrates: Final report, 15:50366 (R;US)
Viscoplasticity theory based on overstress: The modeling of cyclic hardening of AISI Type 304 stainless steel, 15:51124 (RA;US)

STAINLESS STEEL-308
A study of chromium carbide precipitation at interphase boundaries in stainless steel welds, 15:51137 (R;US)

STAINLESS STEEL-310
Coal ash deposition and interaction with metal substrates: Final report, 15:50366 (R;US)

STAINLESS STEELS
Fabrication development for high-level nuclear waste containers for the tuff repository: Phase 1 final report, 15:50613 (R;US)
US DOE-AECL cooperative program for development of high-level radioactive waste container fabrication, closure, and inspection techniques, 15:50615 (R;US)

STANDARD ELECTROWEAK MODEL
See WEINBERG-SALAM GAUGE MODEL

STANDARD MODEL
Electroweak interactions at the SSC, 15:52096 (BA;US)
New gauge boson mass bounds from radiative corrections, 15:52059 (R;US)
Number of generations related to coupling constants by confusion, 15:52124 (RA;DD)
Radiative corrections and Z′ searches at ep colliders, 15:52058 (R;US)
Radiative corrections in $SU_2 \times U_1$: LEP/SLC, 15:52041 (BA;US)
Reduction of coupling and its application, 15:52125 (RA;DD)
The strongly coupled standard model, 15:52143 (BA;US)

STANDING CROP
See BIOMASS

STANFORD LINEAR ACCELERATOR CENTER
The status of SLC commissioning, 15:51982 (BA;US)

STANFORD LINEAR COLLIDER
A status report on the SLC program, 15:52036 (BA;US)
Controlling multi-bunches by a fast phase switching, 15:51519 (R;US)
Plans for polarized beams at the SLC, 15:51565 (BA;US)
Radiative corrections in $SU_2 \times U_1$: LEP/SLC, 15:52041 (BA;US)
Searching for fourth-generation fermions at high-energy e^+e^- machines, 15:52044 (BA;US)
Simulating longitudinal phase space in the SLC, from the damping rings to the final focus, 15:51516 (R;US)
The status of SLC commissioning, 15:51982 (BA;US)

STAR EVOLUTION
Gravitational and dynamical instabilities of a decelerating plane-parallel slab of finite thickness, 15:51933 (BA;US)
Models for x-ray emission from Tycho's remnant, 15:51929 (BA;US)
Radio emission from young supernova remnants: Effects of an inhomogeneous circumstellar medium, 15:51930 (BA;US)

STATE BUILDINGS
See PUBLIC BUILDINGS

STATIC RESERVOIR PRESSURE
See RESERVOIR PRESSURE

STATISTICS
FREQFIT: Computer program which performs numerical regression and statistical chi-squared goodness of fit analysis, 15:52608 (R;US)

STEAM DRIVE PROCESS
See FLUID INJECTION PROCESSES

STEAM GENERATORS
SIKADE-2: A computer code to simulate dynamics of gas-fired steam generators. Description and user aid, 15:50760 (R;DE;In German)

STEAM INJECTION
Characterization of surfactants as steamflood additives, 15:50446 (R;US)
Verification of scaling approaches for steam injection experiments, 15:50527 (RA;CA)

STEAM SOAK PROCESSES
Effect of bottom and top water on cyclic steam stimulation response, 15:50526 (RA;CA)

KE/KW Operations Standardization and Water System Upgrades Program: Program plan: Revision 1, 15:50556 (R;US)
PUREX Storage Tunnels dangerous waste permit application: Volume 3, 15:50568 (R;US)
STORAGE RINGS
See also HERA STORAGE RING
LEP STORAGE RINGS
PEP STORAGE RINGS
SUPERCONDUCTING SUPER COLLIDER
TRISTAN STORAGE RINGS
Construction and setting to work of a dipole field measurement machine, 15:51571 (R;DE;In German)
Criteria for the use of digital signal processors in the control technique of the COSY particle accelerator using the example of the MOTOROLA DSP56000, 15:51572 (R;DE;In German)
Design and construction of a measurement amplifier for use in the beam diagnosis of an accelerator ring plant, 15:51537 (R;DE;In German)
Electronuclear experiments on internal target of the NR-2000 device, 15:51574 (R;UA;In Russian)
Long-term behavior of particle orbits in storage rings, 15:51575 (R;US)
Spin matching conditions in large electron storage rings with purely horizontal beam polarization, 15:51570 (R;US)
STORES
See COMMERCIAL BUILDINGS
STRAND BREAKS
3-Aminobenzamide, an inhibitor of poly(ADP-ribose) polymerase, is a stimulator, not an inhibitor, of DNA repair, 15:51860 (J;US)
STRANGE BARYONS
See HYPERONS
STRANGE PARTICLES
See also HYPERONS
Exclusive neutral strange particle production from double Pomeron exchange produced by proton-proton interactions at $\sqrt{s}$ = 62 GeV, 15:52019 (R;US)
STRAW
Pyrolysis and gasification of straw: Part report 2: Tar produced during the pyrolysis of straw as a fluid fuel, 15:50668 (R;DK;In Danish)
STRAWBERRIES
Development of technology for plantlet propagation by tissue culture. 1.: Effect of plant hormones on strawberry callus formation and their regeneration, 15:51844 (R;JP;In Japanese)
STREAK CAMERAS
Development of an x-ray framing camera, 15:52404 (BA;US)
High-yield direct drive experiments at Nova, 15:52390 (BA;US)
Space and time resolving spectrograph for fusion plasma diagnostics, 15:52416 (BA;US)
Streak cameras capture x-ray laser emissions, 15:52470 (J;US)
The JET soft x-ray diode array diagnostic, 15:52384 (BA;US)
STREAMS
See also RIVERS
Installation-Restoration Program Stage 5. Informal technical information report, analytical data summary. Preliminary pathways assessment - surface-water and stream-sediment samples. Final report, January 1989-March 1990, 15:51722 (R;US)
STRESS ANALYSIS
Mono- and poly-circle theorems in solids and fluids, 15:51390 (RA;US)
STRING MODELS
A physical interpretation of the 3rd cocycle in the group cohomology of nonAbelian gauge theories, 15:52137 (BA;US)
Calculation of the static inter-quark potential in the string model in the timelike gauge, 15:52112 (RA;DD)
Gauge invariance of the first-quantized bosonic string, 15:52116 (RA;DD)
Partition function for N=2 superstring on the torus, 15:52103 (R;XA)
Regularized bosonic string theory, 15:52117 (RA;DD)
Strings in general background fields, 15:52111 (RA;DD)
Superstrings, 15:52092 (BA;US)
The confusion mechanism and the heterotic string, 15:52123 (RA;DD)
STRONG INTERACTIONS
Theory and phenomenology of strong and weak interaction high energy physics: Progress report, 15:52053 (R;US)
STRONG-COUPLING MODEL
A new phase of QED and narrow peaks in heavy-ion collisions, 15:52133 (BA;US)
The strongly coupled standard model, 15:52143 (BA;US)
STRONTIUM
Effects of mineralogy on the sorption of strontium and cesium onto Calico Hills tuff, 15:50563 (R;US)
STRONTIUM COMPOUNDS
See also STRONTIUM OXIDES
Simultaneous particulates, NO_x, SO_x removal from flue gas by all solid-state electrochemical technology: Final report, July 15, 1987–January 31, 1990, 15:50763 (R;US)
STRONTIUM OXIDES
Critical current densities in neutron irradiated high-T_c single crystals, 15:51173 (R;US)
Explanation of normal-state properties of high-temperature superconductors, 15:51230 (J;US)
Hall effect and electronic structure of $La_{2-x}Sr_xCuO_4$, 15:51226 (J;US)

High-resolution angle-resolved photoemission study of the Fermi surface and the normal-state electronic structure of $Bi_2Sr_2CaCu_2O_8$, 15:51225 (J;US)
Magnetic anisotropy of high-T_c superconductors, 15:51227 (J;US)
Sputtered superconducting films of $Bi_2Sr_2CaCu_2O_x$ made by low-temperature, *in situ* growth, 15:51219 (J;US)
X-ray absorption studies of $YBa_2Cu_3O_{6+x}$, $La_{2-x}Sr_xCuO_4$, and $Nd_{2-x}Ce_xCuO_4$, 15:51217 (J;US)

STRUCTURAL BUCKLING

Flux noise in thin films, 15:51249 (RA;US)
High-energy helium backscattering for the compositional analysis of thin-film oxide-superconductors, 15:51461 (BA;US)
Noise at the resistive transition: Bolometers, 15:51581 (RA;US)

SUPERCONDUCTING MAGNETS
A conceptual design of the International Thermonuclear Experimental Reactor for the Central Solenoid, 15:52535 (R;US)
A model for the prediction of Nb_3Sn critical current as a function of field, temperature, strain, and radiation damage, 15:52528 (R;US)
Cryotribology and cryomechanics for superconducting magnet technology, 15:51439 (RA;US)
Electrical insulation requirements and test procedures for SSC dipole magnets, 15:51527 (R;US)
FENIX [Fusion ENgineering International eXperimental]: A test facility for ITER [International Thermonuclear Experimental Reactor] and other new superconducting magnets, 15:52536 (R;US)
Self-compression of the multilayer insulation around the horizontal cylindrical shield, 15:51468 (BA;US)

SUPERCONDUCTING QUANTUM INTERFERENCE DEVICES
See SQUID DEVICES

SUPERCONDUCTING SUPER COLLIDER
Beam transfer between the coupled cavity linac and the low energy booster synchrotron for the SSC [Superconducting Super Collider], 15:51557 (R;US)
Computer automated data acquisition and control for measurement of scintillation materials and scintillating fibers, 15:51599 (J;US)
Design studies of Superconducting Super Collider (SSC) low-energy- beam-transport system using einzel lenses, 15:51555 (R;US)
Electroweak interactions at the SSC, 15:52096 (BA;US)
Potential for collaboration on the Superconducting Super Collider, 15:51490 (R;US)
The Superconducting Super Collider (SSC) linac, 15:51499 (R;US)

SUPERCONDUCTIVITY
High-temperature superconductivity in perspective, 15:52316 (R;US)

SUPERCONDUCTORS
See also TYPE-II SUPERCONDUCTORS
Correlations between frequency of infra-red active vibrational modes and copper-oxygen distance in copper oxides, application to superconductors, 15:52309 (R;XA)
Critical temperature in the two-zone superconductor model with account of Coulomb repulsion, 15:52311 (R;UA;In Russian)
New k-phase materials, k-$(ET)_2Cu[N(CN)_2]X$: X = Cl, Br and I: The synthesis, structure and superconductivity above 11 K in the Cl (T_c= 12.8 K, 0.3 kbar) and Br(T_c= 11.6 K) salts, 15:51257 (R;US)
Structure-property relationships for β- and κ-phase BEDT-TTF salts and their use in the synthesis of κ-(BEDT-TTF)$_2$Cu[N(CN)$_2$]Br: A salt having the highest-Tsub c (inductive onset = 11.6K, resistive onset = 12.5K) yet observed in an organic superconductor, 15:51236 (R;US)
The new superconductors: Prospects for applications, 15:51220 (J;US)
Understanding process-induced microstructures in RBa_2Cu_{307}, 15:51215 (J;US)

SUPERCRITICAL FLOW
See TURBULENT FLOW

SUPERFUND
Compliance
Ecosystem effects of Superfund. National Priority List sites in industrial landscapes: A framework for policy decisions. Technical report, 15:50980 (R;US)
Policy for Superfund compliance with the RCRA land-disposal restrictions. Directive (Final), 15:51709 (R;US)
Site Enforcement Tracking System (SETs): PRP national listing by site, 15:50957 (R;US)

Data Covariances
SI/HRS Information Bulletin. Directive (Final), 15:50981 (R;US)

Directories
Oswer-Superfund telephone directory. Directive, 15:50975 (R;US)

Enforcement

Site Enforcement Tracking System (SETS): PRP listing by site for Illinois, 15:50969 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Indiana, 15:50970 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Kentucky, 15:50964 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Michigan, 15:50971 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Minnesota, 15:50972 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Mississippi, 15:50965 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for North Carolina, 15:50966 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Ohio, 15:50973 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Region 4, 15:50960 (R;US)

Site Enforcement Tracking System (SETS): PRP listing by site for South Carolina, 15:50967 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Tennessee, 15:50968 (R;US)
Site Enforcement Tracking System (SETS): PRP listing by site for Wisconsin, 15:50974 (R;US)

Financing
Flexible funding in the regional extramural operating plan - Superfund Management Review, Recommendation No. 10. Directive (Final), 15:50976 (R;US)

Land Use
Some major factors important in establishing land-use policy for remediated Superfund sites. Technical report, 15:51710 (R;US)

SUPERLATTICES
Optical properties of metallic Fibonacci quasi-superlattice, 15:52277 (R;XA)

SUPERMULTIPLETS
Coulomb interaction in the supermultiplet basis, 15:52107 (R;SU)

SUPERNOVA REMNANTS
IRAS observations of collisionally heated dust in Large Magellanic Cloud supernova remnants, 15:51932 (BA;US)
Infrared spectroscopy and mapping of IC443, 15:51931 (BA;US)
Models for x-ray emission from Tycho's remnant, 15:51929 (BA;US)
Radio emission from young supernova remnants: Effects of an inhomogeneous circumstellar medium, 15:51930 (BA;US)

SUPERNOVAE
Adiabatic supernova expansion into the circumstellar medium, 15:51928 (BA;US)
Gravitational and dynamical instabilities of a decelerating plane-parallel slab of finite thickness, 15:51933 (BA;US)
Supernovae, 15:51927 (B;US)
X-ray emission due to interaction of SN1987A ejecta with its progenitor's stellar-wind matter, 15:51924 (R;JP)

SUPERSONIC FLOW
Experimental and theoretical studies of condensation dynamics in a supersonic nozzle, 15:51410 (RA;US)

SUPERSYMMETRIC PARTICLES
See SPARTICLES

SUPERSYMMETRY
Anomalies, cocycles and Schwinger terms, 15:52097 (BA;US)
Aspects of superstring theory, 15:52142 (BA;US)
Limits on the masses of supersymmetric particles from 1.8 TeV $\bar{p} - p$ collisions, 15:52099 (BA;US)
Nonlinear Schroedinger model, Grassmann variable and solitons, 15:52089 (RA;DD)
On supersymmetric anomalies, 15:52088 (RA;DD)
Problems of describing spin −3/2 baryon resonances in the effective lagrangian theory, 15:52139 (BA;US)
Radiative corrections in $SU_2 \times U_1$: LEP/SLC, 15:52041 (BA;US)
Signatures of supersymmetry at the CERN collider, 15:52095 (BA;US)
Superstrings, 15:52092 (BA;US)
Supersymmetric gauge theories, 15:52086 (RA;DD)
Supersymmetric quantum mechanics in curved manifold, 15:52087 (RA;DD)

SUPERVOLTAGE RADIOTHERAPY
See RADIOTHERAPY

SUPPORTS
Further work on design and stability of roadway support systems, 15:50343 (R;XE)

SUPPORTS (CATALYST)
See CATALYST SUPPORTS

SURFACE AIR
Radionuclide concentration in ground-level air from 1988 to 1989 in North Germany and North Norway, 15:51680 (R;DE)

SURFACE BOILING
See SUBCOOLED BOILING

SURFACE FINISHING
Deburring and surface finishing: The past ten years and projections for the next ten years, 15:51091 (R;US)
The Robotic Edge Finishing Laboratory, 15:51396 (R;US)

SURFACE PROPERTIES
Coal surface control for advanced fine coal flotation: Annual report, October 1, 1988–December 31, 1989, 15:50259 (R;US)
Recent developments in PAC surface studies, 15:52283 (RA;PL)

SURFACE WATERS
See also LAKES
SEAS
STREAMS
WATER RESERVOIRS
Design and construction of the Interim Waste Management Facility: SWSA 6, 15:50564 (R;US)
Health assessment for Potter's Septic Tank Service Pits, Maco, Brunswick County, North Carolina, Region 4. CERCLIS No. NCD981023260. Preliminary report, 15:51754 (R;US)
Health assessment for Redwing Carriers, Inc. (Saraland), Saraland, Alabama, Region 4. CERCLIS No. ALD980844385. Preliminary report, 15:51756 (R;US)
Health assessment for Richardson Flat Tailings, Park City, Summit County, Utah, Region 8. CERCLIS No. UTD980952840. Preliminary report, 15:51755 (R;US)
Health assessment for Savage Municipal Well, Milford, Hillsborough County, New Hampshire, Region 1. CERCLIS No. NHD980671002 (amended). Preliminary report (Final), 15:51746 (R;US)
Hydrological conditions at the 317/319 Area at Argonne National Laboratory, 15:51723 (R;US)
Hydrological conditions at the 800 Area at Argonne National Laboratory, 15:51724 (R;US)
Major ion dynamics of surface waters of varying hydrologic order, 15:51734 (R;CA)
The impact of acidification on the economic value of recreational fishing in Quebec, 15:50954 (R;CA)
The impact of acidification on the economic value of recreational fishing in eastern Canada, 15:50942 (R;CA)

SURFACE-ACTIVE AGENTS
See SURFACTANTS

SURFACES
A molecular dynamics model of the orthogonal cutting process, 15:51143 (R;US)
Coal surface control for advanced physical fine coal cleaning technologies: Annual report, September 19, 1988–December 31, 1989, 15:50258 (R;US)
Dynamics of surface melting: Progress report, 1 January 1990–31 December 1990, 15:52275 (R;US)
Elastic and inelastic interaction in STEM [Scanning Transmission Microscope], 15:52245 (RA;US)
Energy loss of a charged particle moving near the surface of a superlattice, 15:52242 (RA;US)
Recoil saturation of the self-energy in atomic systems, 15:52247 (RA;US)

SURFACTANTS
Electron spin resonance and electron spin echo modulation spectroscopic studies of the photoionization of phenothiazine derivatives in alkyl sulfate and alkyltrimethylammonium bromide micellar solutions, 15:51356 (J;US)
Foam forming surfactants in Pembina/Ostracod G Pool, 15:50417 (RA;CA)
Use of surfactants in the bioremediation of petroleum-contaminated soils. Technical report, 15:50489 (R;US)

SUSPENSIONS
See also SLURRIES
Sedimentation of particles through quiescent suspensions, 15:51400 (RA;US)
Settling velocity measurements of mud flocs in the river Ems, comparison with measurements in the river Elbe, 15:51733 (R;DE;In German)
The settling velocity of suspended solid matter in the river Elbe at Lauenburg and Bunthaus, August 1989, 15:51732 (R;DE;In German)

SUSPENSIONS (FUEL)
See FUEL SLURRIES

SWEDEN
An environmentally adapted energy system, 15:51000 (R;SE)

An environmentally adapted energy system: English-language summaries of appendices 1-3 of the main report, 15:51001 (R;SE)
Distribution nets for distric heating: An overview and status report, 15:51097 (R;SE;In Swedish)
Indigenous fuels, 15:50661 (R;SE;In Swedish)
New radiation protection legislation in Sweden, 15:50646 (R;SE)

SWINE
Pathophysiology and toxicokinetic studies of blue-green algae intoxication in the swine model. Annual report, 1 September 1987-31 August 1988, 15:51836 (R;US)

SWITCHES
8.5 MW GaAs pulse biased switch optically controlled by 2-D laser diode arrays, 15:51481 (J;US)

SWITCHING CIRCUITS
50 kA, 50 kV DC international and switching systems for the Los Alamos ZTH experiment, 15:52510 (R;US)

SYMMETRY BREAKING
Dynamics of symmetry breaking in strong coupled QED, 15:52132 (BA;US)

SYMPOSIA
See MEETINGS

SYNCHROPHASOTRONS
See SYNCHROTRONS

SYNCHROTRON RADIATION
Prospects for new inorganic scintillators, 15:51600 (J;US)
Radio emission from young supernova remnants: Effects of an inhomogeneous circumstellar medium, 15:51930 (BA;US)

SYNCHROTRON RADIATION SOURCES
See also KEK PHOTON FACTORY
Experimental and analytical studies on fixed mask assembly for APS with enhanced cooling, 15:51529 (R;US)

SYNCHROTRONS

Ballooning Instability
Nonlinear saturation of ideal interchange modes in a sheared magnetic field, 15:52355 (R;US)
Charged-Particle Transport
Electron cyclotron current drive by radial transport of particles in a tokamak, 15:52459 (J;US)
RF induced transport in tokamak plasmas, 15:52487 (J;US)
Drift Instability
Weak turbulence theory of collisionless trapped electron driven drift instability in tokamaks, 15:52373 (R;US)
Ecr Heating
A review of recent results with Electron Cyclotron Heating in tokamaks, 15:52457 (J;US)
ECH by FEL and gyrotron sources on the Microwave Tokamak Experiment (MTX) tokamak, 15:52544 (R;US)
ECH on the MTX, 15:52462 (J;US)
Optimum launching of electron-cyclotron power for localized current drive in a hot tokamak, 15:52461 (J;US)
Preparation for propagation and absorption experiments in MTX, 15:52458 (J;US)
High-Frequency Heating
RF induced transport in tokamak plasmas, 15:52487 (J;US)
Icr Heating
Analytic theory of ICRF minority heating, 15:52477 (J;US)
ICRF Faraday shield plasma sheath physics: the Perkins paradigm, 15:52476 (J;US)
Performance of internally sealed IRF antennas in CCT, 15:52557 (J;US)
Theoretical studies of ICRH in stellaratores and tokamaks, 15:52474 (J;US)
Kev Range 10-100
Ion-surface interaction system (ISIS) for the study of redeposited materials: An application of decelerated ion beams with quartz-crystal microbalances, 15:52307 (J;US)
Limiters
Ion-surface interaction system (ISIS) for the study of redeposited materials: An application of decelerated ion beams with quartz-crystal microbalances, 15:52307 (J;US)
Lower Hybrid Heating
Pulsed lower-hybrid wave penetration in reactor plasmas, 15:52466 (J;US)
Wave propagation in a tokamak at lower hybrid frequencies, 15:52467 (J;US)
Magnetic Fields
Magnetic field measurement based on Zeeman effect in charge exchange recombination excited lines, 15:52383 (BA;US)
Pellet Injection
A fuel pellet injector for the Microwave Tokamak Experiment (MTX), 15:52533 (R;US)
Plasma Diagnostics
Multichordal charge exchange recombination spectroscopy on the D3-D tokamak, 15:52431 (BA;US)

Plasma tomography using transient synchrotron radiation, 15:52483 (J;US)
Two-dimensional tokamak density distribution measurements using phase-imaging interferometry, 15:52442 (BA;US)

Plasma Instability
Alpha particle destabilization of the toroidicity-induced Alfven eigenmodes, 15:52371 (R;US)

Sawtooth Oscillations
Turbulent enhancement of particle and heat fluxes during sawtooth oscillations in a tokamak edge plasma, 15:52493 (J;US)

Start-Up
Optimum launching of electron-cyclotron power for localized current drive in a hot tokamak, 15:52461 (J;US)

Statistics
A statistical approach to plasma profile analysis, 15:52361 (R;DE)

Wave Propagation
Wave propagation in a tokamak at lower hybrid frequencies, 15:52467 (J;US)

X-Ray Detection
Radial and tangential scanning of the hard x-ray Bremsstrahlung emission from tokamak plasmas, 15:52439 (BA;US)

Structural Chemical Analysis
Atomic scale structure of twin boundary in Y-Ba-Cu-O superconductors, 15:51203 (BA;US)
Superconductivity
Large critical current densities in $YBa_2Cu_3O_{7-x}$ thin films made at high deposition rates, 15:51229 (J;US)
Synthesis and property evaluation of $YBa_2Cu_3O_{6+x}$ superconductors. Interim report, October 1988-September 1989, 15:51169 (R;US)
[High T_c superconductivity]: Foreign trip report, April 12, 1990–June 8, 1990, 15:51191 (R;US)
Synthesis
Synthesis and property evaluation of $YBa_2Cu_3O_{6+x}$ superconductors. Interim report, October 1988-September 1989, 15:51169 (R;US)
Thermal Conductivity
Photothermal measurements of high-T_c superconductors, 15:51179 (RA;US)

YUCCA MOUNTAIN
Evaluation of the geologic relations and seismotectonic stability of the Yucca Mountain area, Nevada Nuclear Waste Site Investigation (NNWSI): Final report, January 1, 1987–June 30, 1988: Volume 1, 15:50566 (R;US)
Exploratory Shaft Seismic Design Basis Working Group report: Yucca Mountain Project, 15:50606 (R;US)
Plans for characterization of the potential geologic repository site at Yucca Mountain, Nevada, 15:50627 (BA;US)
Simulation of heat transfer in the unsaturated zone, 15:50632 (BA;US)
Surface-based site characterization testing to determine the suitability of the Yucca Mountain site for a nuclear waste repository, 15:50626 (BA;US)
[Nuclear waste containment at Yucca Mountain], 15:50623 (BA;US)

YUKON TERRITORY
Yukon fish and effects of causeways, 15:50491 (R;CA)

Z

Z NEUTRAL BOSONS
A search for new particles in Z decay, 15:52027 (R;US)
High Energy Physics Program at the University of Alabama: Annual report, April 1, 1990–September 30, 1990, 15:52009 (R;US)
Order α^2 δ corrections to W and Z transverse momentum distributions at the SPS and Tevatron colliders, 15:52043 (BA;US)
Radiative corrections and Z' searches at ep colliders, 15:52058 (R;US)
Searching for fourth-generation fermions at high-energy e^+e^- machines, 15:52044 (BA;US)

Theoretical implications of the W-Z mass difference and the capabilities of the D0 detector in measuring it, 15:52029 (BA;US)
$Z^0 \rightarrow N_4 \bar{\nu} \rightarrow$monojet, 15:52033 (BA;US)

Z PINCH DEVICES (LINEAR)
See LINEAR Z PINCH DEVICES

ZEEMAN EFFECT
Magnetic field measurement based on Zeeman effect in charge exchange recombination excited lines, 15:52383 (BA;US)

ZEEMAN RESONANCE
See ZEEMAN EFFECT

ZEEMAN SPECTRUM
See ZEEMAN EFFECT

ZEEMAN TRANSITION
See ZEEMAN EFFECT

ZEOLITES
See also CLINOPTILOLITE
Secondary reactions on metal-zeolite catalysts used in synthesis gas conversion, 15:50299 (J;US)

ZET PINCH
See LONGITUDINAL PINCH

ZINC
Effect of electrolyte composition on zinc plating in zinc-bromine battery electrolytes, 15:50921 (BA;US)
Improved anode catalysts for coal gas-fueled phosphoric acid fuel cells: Final report, 15:51033 (R;US)
Improved cycle-life performance with alkaline-carbonate electrolytes in Zn/NiOOH cells, 15:50923 (BA;US)
Research on the metallurgical determinants of formability in electrogalvanized sheet, 15:51135 (R;US)
Textural characterization and its applications on zinc electrogalvanized steels, 15:51136 (R;US)

ZINC COMPLEXES
EXAFS studies of zincate complexes in alkaline electrolyte, 15:50922 (BA;US)

ZINC OXIDES
Methanol and C_2 oxygenate synthesis over cesium doped Cu/ZnO and $Cu/ZnO/Al_2O_3$ catalysts: A study of selectivity and ^{13}C incorporation patterns, 15:50302 (J;US)

ZINC SULFIDES
Investigation of laser-surface interactions and optical damage mechanisms using excitation by pairs of picosecond laser pulses, 15:51269 (J;US)

ZINC-BROMINE BATTERIES
Effect of electrolyte composition on zinc plating in zinc-bromine battery electrolytes, 15:50921 (BA;US)

ZIRCALOY
In-vessel Zircaloy oxidation/hydrogen generation behavior during severe accidents, 15:50885 (R;US)

ZIRCONIUM 100
Reply to "Comment on 'Monopole strength and shape coexistence in the $A \gtrsim 100$ mass region' ", 15:52228 (J;US)

ZIRCONIUM 92
Evidence for the contribution of $0f_{5/2},1p_{3/2}$ proton excitations in the low-lying states in $^{92,94}Zr$, 15:52190 (J;US)

ZIRCONIUM 94
Evidence for the contribution of $0f_{5/2},1p_{3/2}$ proton excitations in the low-lying states in $^{92,94}Zr$, 15:52190 (J;US)

ZIRCONIUM FLUORIDES
Infrared fiber optic sensors for the remote detection of hydrocarbons operating in the 3.3 to 3.36 micron region, 15:51686 (BA;US)

ZIRCONIUM OXIDES
AEM and HRTEM studies of the eutectic system zirconia-mullite, 15:51205 (BA;US)
Alumina/mullite interfaces in mullite/zirconia composites, 15:51206 (BA;US)
Critical review of phase equilibria in the Al_2O_3-SiO_2 system, 15:51200 (BA;US)
Electrochemical vapor deposition of yttria-stabilized zirconia films, 15:51208 (BA;US)
Thermal expansion studies on cathode and interconnect oxide, 15:51210 (BA;US)
[Lattice defects in ionic materials]: Foreign trip report, September 1–16, 1990, 15:51190 (R;US)

ZPPR REACTOR
A survey of control rod measurements in ZPPR and their analysis, 15:50848 (RA;AT)

Contract Number Index

Numbers assigned to DOE contracts announced in documents in this publication are listed. Contract numbers are sorted alphanumerically and list the primary corporate author of the document cited, the citation number, and the report number or other document identification.

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

Codes Used on Index Lines

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R;SU;In Russian). The language designator does not appear if the document is published in English.

ORDER FORM

DOE and DOE Contractors: Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

I. SHIPPING AND PAYMENT INFORMATION

Ordering Address

Name _____ Telephone _____

Address _____

City _____ State _____ Zip _____

Shipping Address (if different from above)

Name _____

Address _____

City _____ State _____ Zip _____

_____

SIGNATURE (Required to validate ALL orders)

II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

III. NTIS ORDERS

☐ Charge NTIS deposit account no.

☐ Check/Money Order enclosed for $

☐ Charge to my ☐ American Express ☐ VISA ☐ Mastercard

_____ _____
Account Number **Card expiration date**

☐ Ship and Bill (see below for restrictions)

Employer identification number (9 digits) _ _–_ _ _ _ _ _ _

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
National Technical Information Service
5285 Port Royal Road
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

IV. SELECTIONS

Order number _____ Report number _____

Abstract number (with vol., issue) _____

Direct access to the world's most comprehensive energy data base

OnLine

The Energy Data Base (EDB), produced by the Department of Energy, Office of Scientific and Technical Information (OSTI), is a computer-readable bibliographic data base containing citations, abstracts, and indexes to all types of domestic and foreign scientific and technical literature on energy, including energy sources, conservation, energy policy, advanced energy systems, environmental aspects of energy, and basic scientific studies in physics, chemistry, biology, and engineering. The EDB contains over 1,500,000 references from worldwide sources. It is updated bimonthly.

The complete data base is leased to two commercial on-line systems and is available on magnetic tape through the National Technical Information Service.

One year of EDB files is available to DOE and its contractors through the OSTI Automated Retrieval System (OARS). The OSTI Integrated Technical Information System (ITIS), which is a communication link to the on-line systems of OSTI and to commercial and other government on-line systems, provides a gateway through which EDB can be accessed by DOE and its contractors on the commercial systems also. Inquiries concerning access by this means should be addressed to:

U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, Tennessee 37831

Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
